Redfish (Sebastes mentella and Sebastes fasciatus)

## in Division 3M

## Recommendation for 2020 and 2021

SC advises that catches should not exceed the $\mathrm{F}_{0.1}$ level given the recent very low productivity of the stock. This corresponds to a TAC of 4319 tonnes in 2020 and 4624 tonnes in 2021.

## Management objectives

No explicit management plan or management objectives have been defined by the Commission. Convention General Principles are applied.

| Convention General Principles | Status | Comment/consideration | $\bigcirc$ | OK |
| :---: | :---: | :---: | :---: | :---: |
| Restore to or maintain at $\mathrm{B}_{\text {msy }}$ | $\bigcirc$ | $B_{m s y}$ unknown. Stock above historical average level |  |  |
| Eliminate overfishing | $\bigcirc$ | $F_{\text {msy }}$ unknown. Catch at a low level over past 25 years | $\bigcirc$ | Intermediate |
| Apply Precautionary Approach | $\bigcirc$ | Candidate Yield per recruit reference points available and used, but need to be confirmed | $\bigcirc$ | Not accomplished |
| Minimise harmful impacts on living marine resources and ecosystems | $\bigcirc$ | VME closures in effect, no specific measures, low bycatch reported |  | Unknown |
| Preserve marine biodiversity | $\bigcirc$ | Cannot be evaluated |  |  |

## Management unit

Catches of redfish in Div. 3M include three species of the genus Sebastes; S. mentella, S. norvegicus (=S. marinus) and S. fasciatus. For management purposes, they are considered as one stock. The assessment and advice are based on data for only two species ( $S$. mentella \& S. fasciatus), labeled as beaked redfish. The TAC advice is adjusted to reflect all three species on the Flemish Cap, based upon the relative species distribution in recent surveys.

## Stock status

The stock is declining after a marked recovery that started in 2002-2003. High levels of biomass were maintained until 2014, supported by low fishing mortalities and individual growth of survivors, but could not be sustained. The decline in abundance is more pronounced, with no perspective to stop in the short term since year classes at recruitment continue to be extremely weak.

## Reference points

No reference points have been adopted.

## Assessment

Input data comes from the EU Flemish Cap bottom trawl survey and the fishery. A quantitative model (XSA) introduced in 2003 was used. Increased natural mortality was assumed from 2006 to 2010, but natural mortality was low (more typical of redfish) in other years. In order to include an independent approach to natural mortality in the 2017 sensitivity $M$ framework, natural mortality was then estimated by a number of published models. There is no evidence that natural mortality has increased recently from the level of 0.1 adopted in the 2017 assessment, and therefore, the 2019 XSA assessment was run with average $M$ in 2017 and 2018 kept at 0.10 .
The next full assessment of this stock will be in 2021.

## Projections

Short term (2020-2022) stochastic projections were carried out for female spawning stock biomass (SSB) and catch, under the most recent level of natural mortality and considering three options for fishing mortality ( $F_{\text {statusquo, }} F_{0.1}$ and $F_{\max }$ ). Projections were initialized at the beginning of 2020 assuming $F_{\text {statusquo }}$ during 2019. Assumed recruitment for 2019 to 2021 is the geometric mean of the most recent recruitments (age 4 XSA, 2015-2017).
Results for the three projection scenarios show biomass declines of 25\% (for $F_{0.1}$ ), 34\% ( $F_{\max }$ ) and 36\% ( $F_{\text {statusquo }}$ ) between 2019 and 2022. In all three scenarios, the biomass remains at a high level relative to historical values but has a low probability of being above 2019 levels.

## Human impact

Mainly fishery related mortality. Other sources (e.g. pollution, shipping, oil-industry) are undocumented.

## Biology and Environmental Interactions

Since 2004 a rapid increase was observed on survey biomass both of golden (Sebastes norvegicus) and Acadian (Sebastes fasciatus) redfish stocks. Due to their shallower depth distributions these two redfish species overlap with cod to an extent greater than deep sea redfish (Sebastes mentella). Since 2006, the cod stock started to recover, while those two redfish stocks declined sharply. Redfish is an important component in the diet of cod, especially in those years when successful recruitment events were observed in redfish stocks.

## Fishery

Redfish is caught in directed bottom trawl fisheries at intermediate depths ( $300-700 \mathrm{~m}$ ), but also as bycatch in fisheries directed for cod and Greenland halibut. The fishery in NAFO Div. 3M is regulated by minimum mesh size and quota.

Recent catch estimates and TACs (' 000 t ) are as follows:

|  | $\mathbf{2 0 1 0}$ | $\mathbf{2 0 1 1}$ | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Effects of the fishery on the ecosystem

General impacts of fishing gears on the ecosystem should be considered. A large area of Div. 3M has been closed to protect sponge, seapens and coral.
