## Recommendation for 2022 to 2024

Scientific Council advises that fishing mortality up to $85 \% F_{m s y}$, corresponding to catches of $22100 \mathrm{t}, 20800 \mathrm{t}$, and 19900 t in 2022 to 2024 respectively, have risk of no more than $30 \%$ of exceeding Flim, and are projected to maintain the stock above $B m s y$.

## Management objectives

No explicit management plan or management objectives are defined by the Commission. Convention General Principles are applied.

| Convention objectives | Status | Comment/consideration |  | OK |
| :---: | :---: | :---: | :---: | :---: |
| Restore to or maintain at $B_{\text {msy }}$ | $\bigcirc$ | $\mathrm{B}>B_{m s y}$ |  |  |
| Eliminate overfishing | $\bigcirc$ | $F<F_{\text {lim }}$ |  | Intermediate |
| Apply Precautionary Approach | $\bigcirc$ | Stock in safe zone of PA framework |  | Not accomplished |
| Minimise harmful impacts on living marine resources and ecosystems | $\bigcirc$ | Bycatch regulations in place for moratorium stocks, general VME closures in effect |  | Unknown |
| Preserve marine biodiversity | $\bigcirc$ | Cannot be evaluated |  |  |

## Management unit

The management unit is NAFO Divisions 3LNO. The stock is mainly concentrated on the southern Grand Bank and is recruited from the Southeast Shoal area nursery ground.

## Stock status

The stock biomass increased from 1994 to 2001, after which it remained stable until 2014. Biomass subsequently declined from $\sim 2$ times $B m s y$ and is currently 1.4 times $B_{m s y}$ ( $B_{m s y}=89790$ tons). There is very low risk of the stock being below $B_{m s y}$ or $F$ being above $F_{m s y}$. Recent recruitment appears to be higher than average.

## Reference points

Blim is $30 \%$ Bmsy and $F_{\text {lim }}$ is $F_{m s y}$ (STACFIS 2004 p 133).

## Projections

Medium-term projections were carried forward to the year 2025 with catch in 2021 assumed to be the TAC=17 000 t . Constant fishing mortality was applied from 2022-2025 at several levels of $F\left(F=0, F_{\text {status } q u o,} 2 / 3 F_{m s y}, 85 \%\right.$ $F_{m s y}$ and $F_{m s y}$ ).
$F_{m s y}$ was estimated to be 0.21 . Fishing at $F_{m s y}$ would first lead to a considerable yield in 2022, but yields are then projected to decline in the medium term with catch at $2 / 3 F_{m s y}, 85 \% F_{m s y}$ and $F_{m s y}$. At the end of the projection period, the risk of biomass being below $B_{l i m}$ is less than $1 \%$ in all cases.

For the $F_{\text {status quo }}$ projections, probability that $F>F_{\text {lim }}=F_{m s y}$ in 2022-2025 was less than 0.04 in the medium term. At $2 / 3 F_{m s y}$, the probability that $\mathrm{F}>F_{\text {lim }}$ was between 0.08 and 0.11 in the medium term. Projected at the level of $85 \% F_{\text {lim }}$, the probability that $\mathrm{F}>F_{\text {lim }}$ ranges between 0.27 and 0.30 and for $F_{m s y}$ projections, this probability increased to 0.50 . For biomass projections, in all scenarios for 2022-2025, the probability of biomass being below Blim was less than 0.01 . The probability that biomass in 2025 is greater than $\mathrm{B}_{2021}$ is $0.48,0.41,0.32$ and 0.26 for projections of $F_{\text {status quo, }} 2 / 3 F_{m s y}, 85 \% F_{m s y}$, and $F_{m s y}$ respectively.

## Assessment

A Schaefer surplus production model in a Bayesian framework was used for the assessment of this stock. The results were comparable to the previous assessment. Input data comes from research surveys and the fishery. Next assessment: 2024.

## Human impact

Mainly fishery related mortality has been documented. Other sources (e.g., pollution, shipping, oil-industry) are undocumented.

## Biology and Environmental interactions

As stock size increased from the low level in the mid-90s, the stock expanded northward and continues to occupy this wider distribution. This expansion of the stock coincided with warmer temperatures.

Despite the increase in stock size observed since the mid-90s, the average length at which $50 \%$ of fish are mature has been lower for both males and females in the recent period. There also seems to have been a slight downward trend in weight at length since 1996. The cause of these changes is unknown.

The Grand Bank (3LNO) Ecosystem Production Unit (EPU) is currently experiencing low productivity conditions and biomass has declined across multiple trophic levels and stocks since 2014.

## Fishery

Yellowtail flounder is caught in a directed trawl fishery and as bycatch in other trawl fisheries. The fishery is regulated by quota and minimum size restrictions. Catches in several years were low due to industry-related factors, but in recent years catches have increased and in 2019 and 2020 were $75 \%$ and $87 \%$ of the TAC respectively. American plaice and cod are taken as bycatch in the yellowtail fishery. There is a $15 \%$ bycatch restriction on American plaice and a $4 \%$ limit on cod.
$\underline{\text { Recent catch estimates and TACs (' } 000 \mathrm{t} \text { ) are as follows: }}$

|  | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TAC | 17 | 17 | 17 | 17 | 17 | 17 | 17 | 17 | 17 | 17 |
| STATLANT 21 | 3.1 | 10.7 | 8.0 | 6.7 | 8.3 | 9.2 | 8.6 | 12.3 | 14.0 |  |
| STACFIS | 3.1 | 10.7 | 8.0 | 6.9 | 9.3 | 9.2 | 8.7 | 12.8 | 14.8 |  |

## Effects of the fishery on the ecosystem

Fishing intensity on yellowtail flounder has impacts on Div. 3NO cod and Div. 3LNO American plaice through bycatch. General impacts of fishing gears on the ecosystem should also be considered. Areas within Divs. 3LNO have been closed to protect sponge and coral.

## Special comments

Management of yellowtail flounder should take into consideration impacts on other stocks. Bycatch in the yellowtail flounder fishery may be impeding recovery of Div. 3NO cod and American plaice in Div. 3LNO, which have both been below $B_{\text {lim }}$ for many years and are currently experiencing reduced productivity conditions. Measures to reduce bycatch of American plaice in the yellowtail flounder fishery in particular, which currently has a $15 \%$ limit, could reduce the impact of fishing on the recovery of that stock. Such measures could include maintaining or reducing the yellowtail flounder TAC, reducing the bycatch limit, or seasonal closures in areas of high bycatch, in order to protect stocks in the collapsed zone.
