## INTRODUCTION

by B. F. Calvin DeBaie

This edition of the Sampling Yearbook, which is in two parts, summarises, as in previous years, the data on lengths, ages and weights of the cod, haddock and flounder in Part One, and redfish in Part Two, which have been collected to further the investigations of the fisheries and fish stocks of the Northwest Atlantic. In this volume tables are given of the length frequencies of samples taken in 1960 from commercial landings or catches as well as from catches of research vessels. Several countries have also submitted age frequency data and age/length tables.

Samples are taken either on shore from commercial landings or at sea from the catches of commercial or research vessels. Where the commercial vessel catch is sampled at sea, the samples are taken either before or after the discarding of small, unmarketable fish. In sampling the landings, samples are usually taken from each of the size categories in which the fish are landed, and the overall length frequency estimated by pooling the samples after weighting by the quantity of fish landed in each size category. Since sampling practices vary among countries, some further "Notes on the Sampling Data" are given on pages xi-xv.

It is the intention of the Commission that the data incorporated in the Sampling Yearbook should be readily intercomparable. To this end, the Commission recommended that the fork length recorded to the nearest centimetre be adopted as the standard measure. It further recommended that the length measurements should be reported by 3-centimetre groups for the cod, by 2-centimetre groups for the haddock and by centimetres for the redfish and flounder. Only two methods of measuring fish are now in common use in the Convention Area: the one is the standard measure noted above, which is extensively used in Subareas 2, 3, 4 and 5; the other is the total length measured to the centimetre below, which is used by a few of the countries fishing in Subarea 1. Measuring to the total length gives a greater length than the standard, but this is compensated to some extent when measuring to the centimetre below, which gives a lesser length. Because of the very small differences involved and the limited data available to establish conversion factors, no conversions to standard measure have been made.

As the order in which the tables were published in Volume 4 of the Sampling Yearbook proved temporarily satisfactory, the same sequence is maintained in this volume, but it is in two parts:

1. (a) The 1960 tables in Part One are arranged by species in the order of cod, haddock and flounder, with a separate section for each species.  
(b) Part Two contains the tables for redfish.

2. Blue pages at the beginning of each section are a guide to the tables within that section.
3. Within a species section, length frequencies are given first, followed by age frequencies and age/length frequencies or keys.

Length and age frequencies are generally given in parts per thousand but in some cases (notably the U.S. data for Subarea 5 haddock landings), as the total numbers landed. Age/length keys are given as the actual number of otoliths read, but in some cases the tables are given in frequencies per mille.

Data are frequently reported separately for the sexes and are so published.

For each length or age frequency the following data are reported if available.

<b>Serial Numbers:</b>	The serial numbers (as given by the scientist reporting the data) of the samples on which the frequencies are based.
<b>Number of Samples:</b>	The number of samples on which the frequencies are based.
<b>Number of Fish Measured or Aged:</b>	The total number of fish measured in all the samples on which the frequencies are based.
<b>Mean Length (cm) or Mean Age:</b>	The estimated mean length or age of the catches or landings represented by their frequencies.
<b>Mean Weight (Kg):</b>	Given as round, fresh weight unless otherwise noted.
<b>Total Wt. Landed (Tons):</b>	The total commercial landings reported in the ICNAF Statistical Bulletin for the month/division, gear and country to which the frequencies refer.
<b>Estimated No. (millions):</b>	This figure is calculated by dividing the total weight landed by the mean weight.

**Mesh or Hook Size:**

The mesh size is given in inches or millimetres and is the internal, stretched diameter of the wet, used mesh unless otherwise stated. Hook sizes are given as the code numbers by which the hooks are sold.

**Range of Depths:**

Given in fathoms (fm) or metres (m). For landings, the depths are given at which fishing has taken place on the trip from which the samples were taken. For catches sampled at sea, the depths are given of the individual sets from which the samples were taken.

In many cases, sampling from different depth zones, and possibly different stocks, in a division are pooled. The number of decimals in the tables is frequently greater than justified by the data. Similarly, the mean weight of the fish and the estimated number of fish landed, etc., are often given to a larger number of decimals than justified by the data or by the conversion factors used.

Weights are always recorded in metric tons round, fresh (i.e. the nominal catch), except where otherwise noted. The conversion factors used are the same as those used in the ICNAF Statistical Bulletins (see Vol. 9, 1959, page 11). The most commonly used are:

- 1.2 for cod and haddock, gutted, head on
- 3.0 for cod and haddock, green salted, landed in Europe
- 2.7 for cod and haddock, green salted, landed in North America or Greenland

In addition to the regular sampling of the commercial and research vessel catches and landings, a number of special data have been reported and are included here: a series of samples reported by Canada to measure the quantity and sizes of cod discarded at sea (page 11, Part 1), and a table giving the weights of whole fish, the liver, the gonads, and the intestines (Portugal, page 195, Part 1).

## NOTES ON THE SAMPLING DATA

### Canada (Maritimes and Quebec)

Reported by W. R. Martin

A. C. Kohler

D. N. Fitzgerald

A. Marcotte

J. M. Boulanger

Commercial landings of groundfish in the provinces of Nova Scotia, New Brunswick and Prince Edward Island have been continuously sampled for size and age composition since 1945. Sampling emphasis has been placed on landings by offshore vessels at the largest groundfish ports, but has also included sampling from the inshore fleets. Length frequencies from routine sampling of the commercial catches and landings and from sampling to measure discarding are reported to the Commission. Age frequency data are not reported.

Landings are normally culled by market categories. Cod are divided into Large (Steak) and Medium (Market) sizes at about 10 pounds fresh, gutted weight. Small (Scrod) cod and haddock are mainly less than 2-1/2 pounds gutted weight. Small round haddock are sometimes landed in a separate market category. These market categories are sampled approximately in proportion to the relative numbers of each in a trip landing. When the final weighout is available, the length frequency of the landings is determined by applying weighting factors to each category. The length frequencies of the sexes are not usually given separately.

Fork length measurements are recorded to the nearest centimetre for each fish. These measurements are reported by 3-centimetre groups for cod, 2-centimetre groups for haddock and by centimetres for flounder. Mesh size is recorded as the approximate inside, stretched, wet used, measurement of an average cod-end mesh. Hook size is given by number, No. 6/0 being the smallest commercial groundfish hook, and No. 14 being the large hook used on longlines by Quebec.

### Canada (Newfoundland)

Reported by A. M. Fleming

A. W. May

W. N. Batton

M. O'Hanlon

Length frequencies based on sampling of the commercial landings of cod, haddock, redfish and American plaice in 1960 are reported. A few samples are given for 1959 for cod traps and jigger. The length frequencies of redfish and American plaice are given by sexes.

Length measurements are made of the fork length and recorded to the nearest centimetre. Sampling is carried out on shore, from both the offshore and inshore fleets. The total weight of each sample is obtained, together with the total weight of the species landed from the trip sampled. By means of the weighting factor determined from these data, each sample frequency is raised to give the estimated numbers of each size in the landings sampled. These raised frequencies are then pooled to give length frequencies by month, type of gear and division, and then compiled in 3-centimetre groups.

The 4-inch mesh size recorded for traps is to be considered a minimum.

Although a range of sizes for the meshes in otter trawl is shown, it can be assumed that these represent the 4-inch mesh or equivalent as recommended by ICNAF. Some changes in hook sizes are to be noted. There has been some difficulty in obtaining actual sizes which can be recognized internationally, since many fishermen order by manufacture number. For example, the handline hooks are Mustad hooks of about 1-1/4 inches in diameter across the hook from the point to the shank and from 3-1/2 to 4-inches long. These are large hooks, much larger than the No. 15 Mustad, and are numbered 3020 and 3021. These are approximately equal to a No. 11 hook. The jigger size is listed as No. 5, is paired and is the largest hook used.

Denmark (Faroes)

Faroese investigations of commercial cod catches were undertaken and reported to the Secretariat for the first time in 1959. No material was available for publication for the year 1960.

Denmark (Greenland)

Reported by Paul M. Hansen

Samples of cod have been taken from the inshore catches of commercial and research vessels and from the offshore catches of research vessels. The samples are not pooled. Length measurements are made of the total length (end of tail lobes) and recorded to the centimetre below. Age frequencies, mean size at each age and age/length keys are also reported.

Germany

Reported by Arno Meyer

Age and length frequencies and age/length keys for the 1960 commercial landings of cod by otter trawlers are reported for the Convention Area, as well as for the Banks off East Greenland.

Length measurements are made of the total length (end of tail lobes) and recorded to the centimetre below. The length frequencies are reported to the Commission in standard 3-centimetre groups.

Where sampling of cod is carried out on shore at the market, each of the three size categories landed is sampled separately, and the final length frequency calculated by weighting each length frequency by the quantity landed in the size category and then pooling the frequencies. The cod from the commercial landings are gutted before being measured. Redfish are measured in the whole round state, except for a few large ones. Otoliths are taken according to length of fish.

Iceland

Reported by Jakob Magnusson

Individual length frequencies of redfish samples taken on two survey cruises in 1960 were reported to the Commission. A summary of these by month/division is published here. Length measurements are taken from total length to nearest centimetre. (Board is offset 0.5 cm to permit reading to nearest cm).

Norway

Length frequencies, age frequencies with mean size at each age and age/length keys are reported for cod. The samples are taken from catches made by research vessels in Divisions 1C, 1D and 1E.

Lengths are reported by the standard 3-centimetre grouping and the age frequencies and age/length keys are given by sexes.

Measurements are made of the fork length to the nearest centimetre.

Some samples for commercial bottom long-line catches are included.

Portugal

Reported by Mario J. Ruivo  
and Glicinia V. Quartin

Sampling at sea of the cod catches (before discarding undersized fish) of the Portuguese otter trawlers and dory vessels has been carried out in 1960 in Subareas 1, 2, 3 and 4. Length frequencies, age frequencies (based on otoliths) with mean size at each age and age/length frequencies by sexes are included in the data reported.

Length measurements are made of the fork length recorded to the nearest centimetre. Samples are not weighted by the quantity caught; when taken on the same fishing bank at the same time, they are generally pooled.

Spain

Reported by O. Rodriguez M.

Length frequencies of the cod catches of the Spanish otter trawlers "Aliseo" and "Vendaval" collected at sea for the year 1960 are reported. Samples are taken from the commercial catch before discarding.

Length measurements are made of the fork length recorded to the nearest centimetre. Length frequencies are reported in the standard 3-centimetre groups as used by ICNAF. Samples are not weighted according to the quantity caught, but are pooled by month/divisions.

Union of Soviet Socialist Republics

Reported by Ju. Ju. Marty  
V.I.Travin  
E.I.Surkova  
E.M.Mankevich

The length and age frequencies of cod and redfish catches are reported. Samples are taken at sea, before discarding, from the catches of exploratory and commercial otter trawlers. The data submitted has increased by ten-fold over that of the previous year.

United Kingdom

Reported by C.E.Lucas  
G.C.TROUT  
R.J.H.Beverton

The length composition of the cod landings of the United Kingdom otter trawlers from Subarea 3 is reported. Measurements are made of the total length to the centimetre below. Samples are taken of each of the size categories into which the landings are divided; the length frequencies so obtained are then pooled, after weighting by the quantity of fish in the category from which they are taken. This was taken from "Cod Sampling on board a Factory Stern Trawler by G.C.TROUT, Fisheries Research Laboratory, Lowestoft, which was converted from 5 cm to 3 cm grouping by the Secretariat. Data on length frequencies of numbers per 100 hours fishing was taken from U.K. Research Report for 1960.

United States

The length frequencies of the United States landings of cod, haddock and redfish for 1960, and the age/length frequencies of the landings of haddock for 1960/61 are included in this volume. All measurements are made of the fork length to the nearest centimetre.

Compilation of Data

(a) Cod: Subarea 5, Otter Trawlers

Reported by H.E.Murray

Each length frequency sample is weighted by the weight of the landing from which it was obtained (by market category for large, market, scrod; by total cod for mixed). The resulting length frequencies are totalled and weighted by total United States cod landings for otter trawlers by month. These numbers are in turn combined

into length frequencies for total United States otter trawl cod landings for each month. The percentage of fish for each centimetre interval is then computed, combined into 3-centimetre groups, and finally converted to parts per thousand.

(b) Haddock

Reported by J.A. McCann  
F.A. Dreyer  
A.C. Kohler  
D.N. Fitzgerald

The length frequency samples for each month by market category are pooled and the resulting frequency weighted by the total quantity of each category landed from each unit area. The weighted numbers of fish of each category are then pooled to obtain the total length frequency for haddock for each month for each division. Ages are determined from the scales, and age/length frequencies are compiled.

Length frequencies are reported by centimetres and age/length frequencies by 3-centimetre groups.

Length frequencies of haddock by quarters are reported under the United States/Canada Co-operative Programme.

Haddock biostatistical records are reported by the "haddock year": namely, February 1st to January 31st of the following year. The haddock's birth-day is taken as February 1st.

(c) Redfish

Reported by G.F. Kelly  
A.M. Barker  
G.M. Clarke  
P.H. Chase

Samples are taken from the commercial catches of otter trawlers and are pooled without weighting.

**AGE/LENGTH KEYS AND FREQUENCIES (REDFISH)**

In accordance with a recommendation made by the Research and Statistics Committee at their annual meeting in 1962, Age/Length Keys and Frequencies will not be published but are to be deposited in the Secretariat and made available to Member Countries on request. The following Age/Length Keys and Frequencies are now on file in the Secretariat:
