ANNUAL MEETING - JUNE 1966<br>Landings of Canadian (Nfld.) trawlers using small-mesh gear during the 1965 season<br>by A. T. Pinhorn<br>Fisheries Research Board of Canada, Biological Station, St. John's, Nfld.<br>and E. Dunne<br>Department of Fisheries of Canada, Economics Branch, St. John's, Nfld.

In accordance with Recommendation No. 7, ICNAF Redbook 1965, Part I, the landings of the various species by trawlers using small-mesh gear in 1965 were tabulated. These are shown in Table 1 .

The following procedure was followed in selecting the small-mesh gear trips. Officers of the Department of Fisheries of Canada measured the mesh sizes of the gear used on approximately half the trips made by otter trawlers during the year. Trips were selected where measurements indicated the use of small mesh and rejected where large mesh was indicated. Trips for which no measurements were available were considered as large-mesh trips where fishing was for cod, haddock or flounder or where fishing was for redfish but where more than $10 \%$ or 5,000 ib of cod or haddock were caught. They were considered small-mesh trips where fishing was for redfish and less than $10 \%$ of $5,000 \mathrm{lb}$ of cod or haddock were caught.

It is evident from the table that small-mesh gear is generally used when fishing for redfish, especially in $3 \mathrm{P}_{\mathrm{s}}, 3 \mathrm{Pn}, 4 \mathrm{RST}$, and 4 Vns . In 3 N and 30 small-mesh gear is used to a certain extent when fishing for the flounder group. The proportions of cod, haddock, halibut and the incidental species (pollock, hake, wolffish and Greenland halibut) caught with small-mesh gear are very small.

Most of the fishery with small-mesh gear is carried out by vessels of the l5l500 tonnage category in all divisions although in 3Pn and 3Ps (Burgeo Bank area) the smaller vessels of 5l-150 tonnage category use small-mesh gear when fishing for redfish.
