ANNUAL MEETING - JUNE 1976

Scotian Shelf flatfish stocks - implications of 1975 data

by

Introduction

American plaice, witch flounder and yellowtail flounder in Div. 4VWX are regulated together, the 1975 TAC being 32,000 mt. The TAC for 1976 was reduced to 28,000 mt because of observed over-exploitation of plaice in Div 4W and substantial declines in yellowtail stocks.

Research vessel survey results

Plaice - No substantial changes in abundance are observed in the 1970-75 data series, although there are indications of small increases in abundance in Div 4V and Div 4W (Table 1).

Witch - Again, no substantial changes are observed. Higher population estimates in 1974 were not followed by similar estimates in 1975 (Table 2).

Yellowtail - Small increases in abundance estimates occurred in both 1974 and 1975, particularly in Div 4V (Table 3).

In total (Table 4), there are indications of a moderate increase in abundance of flatfish in 1974 and 1975 over the previous four years.

Commercial catch rates

Catch rates of Canadian-side otter trawlers of 150-499.9 gt. show substantial declines from levels in the mid 1960's (Table 5), dropping from 151 kg/hr fished in 1965 to 76 kg/hr in 1974. A moderate increase to 86 mt/hr was observed in 1975. Plaice catch rates increased in both 1974 and 1975, witch decreased in both these years, while yellowtail increased in 1975.

Discussion

Commercial catch rate data do not support research survey data which show increased flatfish abundance in 1974, but do support evidence of a small increase in abundance in 1975. This change does not appear to be of sufficient magnitude to necessitate modification of the management regime.
