NAFO SCS Doc. 80/VI/13

SCIENTIFIC COUNCIL MEETING - JUNE 1980

Efficiency of Sampling the Major Fisheries of the Northwest Atlantic in 1978

by

NAFO Secretariat

Introduction

Quantitative analyses of sampling data reported to the ICNAF/NAFO Secretariat for the years 1973-77, in relation to nominal catches, were previously presented in ICNAF Sum. Doc. 75/11, 76/VI/33, 77/VI/31, 78/VI/11 and 79/VI/14. On the basis of the reported data, these analyses indicated that only about 60% of the stocks analyzed were adequately sampled for length frequencies. In 1977, this value dropped to 53% (34 of 64 stocks examined) (Sum. Doc. 79/VI/14), due largely to the fact that no sampling data had been reported for the stocks in Subareas 5 and 6. The present review utilizes sampling data and nominal catches reported to the Secretariat for 1978.

Materials and Methods

At the 1975 Annual Meeting of STACRES, the recommended minimum sampling requirements were that each country should sample its commercial fisheries at the rate of one length sample per 1,000 tons of a species caught in each quarter of the year, with a corresponding age sample being one fish for each centimeter length group in the length frequency sample for species which can be aged.

Taking one length sample per 1,000 tons of fish as the baseline, the present analysis utilizes the nominal catch statistics for 1978 and the commercial sampling data reported to the Secretariat for that year (SCS Doc. 80/VI/8). Pure research vessel data were not generally used, except in cases where it appeared obvious that the samples were taken with commercial-sized gear and seemed to be associated with significant commercial fishing activity.

All available data for 1978 are summarized in Table 1 by species, country, major gear category (as requested at the June 1979 Meeting), division, and quarter of the year. A summary of major deficiencies is given in SCS Doc. 80/VI/8.

The data for 19 species involving 62 stocks are reviewed in Table 2. The nominal catches (000 tons) are listed by quarter for all countries whose catches were considered large enough to warrant the collection of sampling data whether or not such data were reported to the Secretariat. The % value in parentheses represents the percentage of the total catch covered by the catches listed for each stock.

The "sampling efficiency" is defined as the ratio of the "number of length samples" (from Table 1) to the "nominal catch in 1000-ton units". When sampling data were reported for cases where the nominal catch was less than 500 tons, the sampling efficiency is simply the number of samples (in parentheses). Asterisks (**) under "sampling efficiency" in the right portion of Table 2 indicate the absence of sampling data. Efficiency values less than 1.0 indicate that sampling for length was below the minimum required level, whereas values greater than 1.0 indicate the extent by which the minimum level was exceeded. No attempt is made in this review to assess the adequacy of sampling for age-length keys, but a general impression may be gleamed from the data in Table 1.

Abbreviations for countries correspond with those generally used in ICNAF and NAFO statistical tabulations, except that "FAR" is now used to designate "Faroe Islands" instead of "DEN-F" used in previous reports. The 3-alpha species identifiers in the heading of Table 3 correspond to those recommended by the CWP as follows:

COD - Atlantic cod
HAD - Haddock
RED - Atlantic redfishes
HKS - Silver hake
HKR - Red hake

GHL - Greenland halibut
RNG - Roundnose grenadier
HER - Atlantic herring
MAC - Atlantic mackerel
BUT - Atlantic butterfish

HKW - White hake	ARG - Atlantic argentine
POK - Pollock	CAP - Capelin
PLA - American plaice	SQI - Squid- <i>Illex</i>
WIT - Witch flounder	SQI - Squid- <i>Loligo</i>
YEL - Yellowtail flounder	PAN - Deepwater prawn (shrimp)

Results

Table 3 contains a summary of the information presented in Table 2 by stock area and country. Each entry in the table represents the nominal catch to the nearest 1,000 tons (on an annual basis) and the sampling efficiency as defined above. Asterisks (****) following an entry for nominal catch indicate that no sampling data were reported to the Secretariat. Nominal catches less than 1,000 tons are not generally listed, but, when sampling data were available, these small catches are denoted by "+".

The following breakdown of the finfish, squid and shrimps stocks by sampling efficiency factors for 1978, together with the results for 1977, reflect in a very general way the adequacy (or inadequacy) of sampling for length, based on data reported to the Secretariat:

Species	No. of stocks	1978		No. of stocks	1977	
		<1.0	>1.0		<1.0	>1.0
Cod	12(10)	4 (2)	8	12(10)	4 (2)	8
Haddock	3 (2)	1 (0)	2	3 (2)	1 (0)	2
Redfish	9 (8)	2 (1)	7	9 (8)	3 (2)	6
Silver hake	3 (1)	2 (0)	1	4 (1)	3 (0)	1
Red hake	2 (0)	2 (0)	0	2 (0)	2 (0)	0
Pollock	2 (1)	1 (0)	1	2 (1)	1 (0)	1
American plaice	7 (6)	2 (1)	5	6 (5)	2 (1)	4
Witch flounder	5 (4)	1 (0)	4	5 (4)	2 (1)	3
Yellowtail flounder	3 (2)	1 (0)	2	2 (1)	1 (0)	1
Greenland halibut	2 (2)	1 (1)	1	2 (2)	0	2
Roundnose grenadier	2 (2)	1 (1)	1	2 (2)	2 (2)	0
Herring	2 (1)	2 (1)	0	5 (4)	3 (2)	2
Mackerel	2 (1)	1 (0)	1	2 (2)	1 (1)	1
Butterfish	1 (0)	1 (0)	0	1 (1)	1 (1)	0
Argentine	1 (1)	0	1	1 (1)	0	1
Capelin	2 (2)	0	2	2 (2)	1 (1)	1
Squid- <i>Illex</i>	2 (2)	0	2	2 (2)	1 (1)	1
Squid- <i>Loligo</i>	1 (1)	0	1	1 (1)	1 (1)	0
Shrimp (<i>Pandalus</i>)	1 (1)	1 (1)	0	1 (1)	1 (1)	0
TOTALS	62(47)	23 (8)	39	64(50)	30(16)	34

NOTE: Numbers in parentheses refer to stocks not affected by the absence of USA sampling data for 1978.

With reference to the sampling data indicated in Table 1 and the sampling efficiencies given in Tables 2 and 3, it should be noted that no sampling data for 1978 have yet been received from USA. Consequently the sampling efficiencies for many of the stocks in Subareas 5 and 6 would probably be greater than 1.0 if USA data were included. Therefore, to provide a more realistic comparison, the numbers of stocks in parentheses indicate those not affected by the absence of USA sampling data.

For some of the stocks with sampling efficiency factors greater than 1.0 (Table 3), sampling cannot be considered adequate when some countries with significant catches consistently report no commercial sampling data. It is also apparent from Table 3 that, although sampling data may have been collected by national laboratories, such data have not yet been reported to the Secretariat. Some significant deficiencies in the reporting of length data are as follows:

- Canada(MQ) - Herring and squid-*Illex* in Subarea 4
- Canada(N) - Herring, mackerel and squid-*Illex* in Subarea 3
- Denmark(G) - Greenland halibut and shrimp in Subarea 1
- Faroe Islands - Cod in Div. 3M and shrimp in Subarea 1

F. R. Germany	- Redfish, Greenland halibut and roundnose grenadier in Subarea 1
Norway	- Capelin in Div. 3LNO and shrimp in Subarea 1
Spain	- Cod and squid in all areas fished
USSR	- Redfish in Div. 30 and squid- <i>Illex</i> in Subareas 3 and 4
USA	- No sampling data received for any species.

Conclusions

The sampling data available in the Secretariat for the stocks noted in the foregoing table indicate that 39 of 62 stocks analyzed (63%) were adequately sampled for length composition in 1978, in contrast to 34 of 64 stocks (53%) in 1977. Taking into account only those stocks not affected by the absence of USA sampling data, the corresponding percentages are 83% in 1978 and 68% in 1977, indicating a significant improvement in 1978 sampling.

In the present analysis, only the quantitative aspect of length sampling has been considered. However, the occurrence of the symbol "..." in Table 1 indicates that age-length keys were often not reported with the length frequency data. This deficiency is particularly evident for redfish, Greenland halibut, roundnose grenadier, butterfish and capelin.
