Distribution and Biological Characteristics of Rock Grenadier (*Coryphaenoides rupestris*)  
as Shown by Trawl Surveys in the Northwest Atlantic in 1989-1991

by

P. I. Savvatimsky

ABSTRACT

The paper presents the distribution of grenadier over the area and by depth, size and age compositions, sex ratio of fish in catch from NAFO SA 0, 2, 3. Percentages of grenadier, Greenland halibut and redfish in catch from different depth are given. In 1991, as indicated by the trawl survey, the mean length of grenadier was 50.0 cm and average age - 8.2. As in previous years a sharp increase of the mean length and relative number of females with depth was noted. In 1990 and 1991 the percentage of grenadier in catch was much lower, than in 1971-1977, while its catch size decreased about 10 times. A reduction of the catch per effort was one of the reasons behind the decline of the total catch. Strong correlations were found between the percentage of grenadier in catch from 500-1200 m and total catch of this species (correlation coefficients between 0.86 and 0.95), as well as catch per effort and total catch (correlation coefficients from 0.60 to 0.83).

INTRODUCTION

Fishery for rock grenadier in the Northwest Atlantic was initiated in 1967. Before 1978 the total catch amounted to tens thousands tonnes per year, and it dropped drastically in 1979. Gradually, catch per unit effort declined. In 1989-1991 the catch still remained at a low level. Trawl surveys for bottom fish, conducted on a yearly basis in autumn and winter seasons on the Baffin Land, Labrador and Grand Newfoundland bank showed no grenadier concentrations of commercial importance in the depth range from 500 to 1500 m. The purpose of the present paper is to analyse results from the 1991 survey and compare them with

materials for previous years to study the reasons of catch decline.

#### MATERIAL AND METHODS

The paper uses materials from bottom trawl surveys, carried out annually in autumn and winter seasons. Size frequencies and percentage series, shown in figures, as well as catch per hour tow in kg by 100 m depth intervals during 1971-1977, 1990 and 1991, given in the Table, have been smoothed by the formula:

$B = \frac{a + 2b + c}{4}$ , where a,b,c are preceding, middle and subsequent member in the series, B - estimated member. Before, linear and exponential ( $Y = a + bx$ ,  $Y = \exp(a + bx)$ ) relations were established between the catch of grenadier from 501-1200 m and total catch of this species in SA 0,2,3 in 1972-1988 (Savvatimsky, 1991). The present paper suggests also relations between catch per effort and total catch. Age composition in SA 0,2 and Div. 3K for 1983-1991 was calculated from size frequencies for corresponding years using a combined age key for 1969-1990 (Savvatimsky, 1991).

#### RESULTS AND DISCUSSION

From 18 to 25 September 1991 a total of 31 bottom trawl tows were done in Div. 3K to study the vertical distribution of commercial species. Those tows were done by RV "Kapitan Shaitanov" in the depth interval from 500 to 1500 m and every 100 m. Like in 1990, no grenadier occurred in catch in less than 700 m depth, it accounted for about 50% in catch from 1200 m and reached 90% in the depth range from 1401 to 1500 m (Tables 1,2). Bathymetric distribution of three major species - Greenland halibut, rock grenadier and redfish was the same as in 1990 (Savvatimsky, 1991), however, the catch declined almost twice against 1990.

Trawl survey in Div. OB was conducted from 3 to 17 November 1991 in the range of depth from 201 to 1500 m. Rock grenadier occurred only as a small by-catch in Greenland halibut catch and accounted for about 23% only in 1301-1400 m depth. Grenadier catch did not exceed 25 kg per hour tow. No grenadier were found in the catch north of 64°24'N.

In Div. 2G a trawl survey by RV "Kapitan Shaitanov" was conducted from 26 September to 15 October and 17-21 November and covered the depth range from 200 to 1500 m. Grenadier catch did not exceed 1.1 t (depth 1100-1360 m).

In Div. 2H the survey was conducted from 21 November to 4 December. Grenadier occurred in catch from 380 to 1310 m, the catch did not exceed 150 kg.

Thus, the trawl survey provided evidence, that in 1991 no grenadier concentrations were distributed in traditional depth range over all areas covered.

In 1991 the mean length of grenadier in Divs. OB, 2GR and 3K was 50.0 cm (Table 3), average age - 8.2 years (Table 4). These indices are closely related to the fishing depth. As in previous years, size of males and females and relative number of female grenadier increased with depth in all surveyed areas (Table 3, Fig. 1). Such changes were also indicated by trawl surveys in 1988 and 1989 (Savvatimsky, 1989; 1990). It is worth noting, that in SA 2, where rock grenadier occurred in small numbers in shallower depth (301-400 m) these indices first decreased with depth (to 501-600 m), then increased. This is also evident from Fig. 2, where the mean length is smoothed.

Size composition and relative number of grenadier in catch are closely related to its vertical distribution. The percentage of grenadier in catch in 1990 and 1991 was much smaller, than in 1971-1977 (Fig. 3), and its catch from traditional fishing depth declined about 10 times for the same period (Table 6). This can not be explained by intensive fishing, because the total catch in 1975-1979 was low and a reduction of catch per effort took place later than a decline of the total catch. Nevertheless, a reduction of catch per effort was one of the reasons behind a decline of the total catch. Strong correlations were established between the percentage of grenadier in catch from 501-1000, 1001-1200 and 501-1200 m and total catch in SA 0,2,3 in 1972-1988 (Savvatimsky, 1991). Correlation coefficients were from 0.86 to 0.95 (Table 7). A comparison of mean catch per hour tow for grenadier in trawl surveys in the same period and total catch gave correlation coefficients from 0.60 to 0.83 (Table 8), which was indicative of a strong relation between these indices.

A comparison of standardized catch per effort and total catch of grenadier in SA 2+3 in 1972-1989 (data provided by Atkinson, 1991) for linear relation gave a correlation coefficient 0.786, and 0.716 for exponential relation.

Thus, a decline of the total catch of grenadier was a

consequence of the reduction of percentage of this species in catch and lower catch per effort in traditional fishing depths. The reasons behind the absence of grenadier concentrations of commercial importance in depths accessible to bottom trawl are still not clear.

1101 - 1200	2786,9	37	126,7	29	136,7	15
1201 - 1300	2734,3	15	216,6	6	135,1	22
1301 - 1400	-	-	257,1	7	124,1	13
1401 - 1500	-	-	275,2	3	106,3	3

Table 7 International catch of roundnose grenadier and the percentage of this species in research catches from depth 501-1000, 1001-1200, 501-1200 m in Subareas 0, 2, 3 in 1972-1988 and their correlation.

Year	Total catch, 000t	Roundnose grenadier percentage by weight		
		Depth 501-1000 m	Depth 1001-1200 m	Depth 501-1200 m
1972	30,2	77,9 (189)	100,0 ( 1)	81,6 (190)
1973	18,6	69,6 (312)	99,1 (40)	78,0 (352)
1974	31,1	76,9 (276)	97,7 (33)	82,9 (309)
1975	27,6	78,2 (218)	91,8 (45)	82,1 (263)
1976	23,2	50,2 (249)	89,9 ( 8)	63,0 (257)
1977	16,1	12,4 (197)	78,3 ( -)	12,4 (197)
1978	20,7	42,1 ( 18)	66,7 ( 3)	49,1 ( 21)
1979	7,9	30,4 (159)	60,1 (10)	35,3 (169)
1980	2,1	7,5 ( 66)	16,9 (13)	10,1 ( 79)
1981	7,2	12,1 ( 34)	29,7 ( 4)	9,7 ( 38)
1982	4,4	8,6 (119)	42,6 (32)	10,0 (151)
1983	3,6	7,2 (123)	17,2 (44)	10,1 (167)
1984	3,9	17,6 ( 77)	22,1 (28)	18,9 (105)
1985	5,0	2,4 ( 69)	28,4 (28)	11,1 ( 97)
1986	7,4	22,8 (62)	56,4 (10)	32,4 ( 72)
1987	8,3	17,2 ( 50)	59,6 (30)	29,3 ( 80)
1988	6,4	15,9 ( 78)	52,7 (39)	28,2 (117)

Model  $Y = 2,365 + 0,334X$   $Y = -4,907 + 0,304XY = -0,384 + 0,340X$

Correlation coeff. 0,919 0,901 0,948

Model  $Y = \exp(1,421 + 0,026X)$   $Y = \exp(0,686 + 0,027X)$   $Y = \exp(1,1585 + 0,028X)$

Correlation coeff. 0,861 0,942 0,927

Remark : Figures in brackets refer to numbers of research catches

Table 8 International catch of roundnose grenadier and grenadier mean catches from the trawl survey data from depth 501-1000, 1001-1200, 501-1200 m in Subareas 0, 2, 3 in 1972-1988 and their correlation

Year	Total catch, 000t	Mean catch of roundnose grenadier, kg/hr		
		Depth 501-1000 m	Depth 1001-1200 m	Depth 501-1200 m
1972	30,2	1021,6(189)	545,0 (1)	942,1 (190)
