Norwegian Investigations on Shrimp (*Pandalus borealis*)

in East Greenland Waters in 1991

by

O. M. Smedstad and S. Torheim

Institute of Marine Research, P. O. Box 1870-72  
N-5011 Bergen, Norway

### INTRODUCTION

The Norwegian quota of shrimp in East Greenland waters in 1991 was 2500 tonnes. 22 vessels participated in the fishery. According to the fishing log books received, the data in the present paper represents catches of 2495 tonnes.

Results of field investigations together with commercial fishery data in 1990 were reported by Smedstad and Torheim (1991). The results of the investigations together with fishery data in 1991 are presented in this paper.

### LOCATION OF THE FISHERY

From 29 January to 6 March one of the authors was an observer on board the sterntrawler "Lyshaug". In the period 8 February to 4 March the fishing area of "Lyshaug" was located around 66° N and west of 30° W (Fig.1).

Fig. 6-17 shows the location of the Norwegian fishery from January to December 1991.

### MATERIAL AND METHODS

The shrimp were sorted in "landing" and "discard" categories after they were separated from fish species in the catch.

Details of the trawl hauls examined by the observer are given in Table 1. Random samples of shrimp were taken for length measurements (Carapace length to nearest mm below) (Table 2). In addition length compositions were obtained from by-catches of Greenland halibut (Fig.3) and redfish (Fig.4).

Monthly catch and effort data from 1984-1991 are compiled from the vessels participating in the fishery (Table 3).

### SIZE AND SEX COMPOSITION OF SHRIMP

Length compositions in samples collected by the observer on board "Lyshaug" are given in Table 2 and Fig.2. Shrimp with modal group 30 mm length were dominating.

On an average the samples consisted of 41.3 % males, 1.2 % transitinals, 2.3% females without roe, 10.7 % with headroe and 44.5 % were eggbearing (Br - E).

## DISCARD

The quantity of discard varied from 0-5.1 %. On an average about 0.8% of the total catch was discarded.

## CATCH AND CATCH PER UNIT EFFORT

Table 3 shows catch and catch per hour trawling (CPUE) by month for the Norwegian fishery off East Greenland (ICES Div. XIV B) from 1984 to 1991. The quarterly CPUE for the period 1982 to 1991 are shown in Fig.5.

## BY-CATCHES IN THE SHRIMP FISHERY

By-catches of fish in the trawl hauls of "Lyshaug" examined by the observer are listed in Table 1. The major by-catch continues to be redfish. The categories other consists of skate, plaice and catfish.

None of the fish were kept onboard. The mean number of fish relative to the mean shrimp catch (retained) per tow for the years 1982-1990 are given in the table below.

Species	Mean number per tow.								
	1983	1984	1985	1986	1987	1988	1989	1990	1991
