SCIENTIFIC COUNCIL MEETING - JUNE 1993

Portuguese Research Report for 1992

by

A. Avila de Melo, M. L. M. Godinho, R. R. Alpoim and E. Santos
Instituto Nacional de Investigacao das Pescas
Av. de Brasilia, 1400 Lisboa, Portugal

A. Status of the fisheries.

The Portuguese nominal catches recorded an overall decrease of 52% from 1991 (75,314 ton) to 1992 (36,219 ton). The closure of the fishery for the most important stocks in July lead to a severe reduction in the nominal catches of cod, redfish and American plaice in all divisions and for both trawl and gillnet fleets.

Nominal trawl catches of cod have declined in Divisions 3L and 3N, from 8,326 ton in 1991 to 3274 ton in 1992 and from 674 ton to 183 ton respectively. The trawl cod catches in Division 3M were relatively stable at 2,039 ton in 1992 (compared with 2,321 ton in 1991). As for the cod gillnet nominal catches, there is a decline in Div. 3M from 516 ton to 162 ton, while in Div. 3N the small increase observed of 247 ton in 1992 compared with the 197 ton of 1991 did not balance the drop observed in Div. 3O from 172 ton to 6 ton.

For redfish, the decline recorded for trawl in Div. 3L, from 5076 ton in 1991 to 709 ton in 1992, was the main cause to the fall of the total catch of these species to almost half of the 1991 value (12,163 ton in 1991 to 6,581 ton in 1992), which in turn represented 70% of the 1990 catches. In the other Divisions, and if considering 3N and 3O as a whole, although recording minor decreases the trawl redfish catches were kept at the same level.

Nominal trawl catches of Greenland halibut in Div. 3N were stabilized at 3,506 ton, doubled in Div. 3M reaching 4,232 ton but in Div. 3L declined 75% from 1991, to just 2122 ton in 1992. The most important unquoted species have recorded important reductions in 1992, with special reference to skates which fall from 23,301 ton in 1991 to 7 017 ton in 1992. The skate nominal catches from trawl for Div. 3L were the major cause of this decline.

The Portuguese fleet operating in the NAFO Regulatory Area in 1992 was composed of 19 trawlers and 6 gillnetters. Trawl effort has declined 55% from the previous year, mainly in Div. 3L (-75%) and in Division 3N (-40%). Nevertheless, in Div. 3O trawl effort in fishing hours increased from 332 hours in 1991 to 2281 hours in 1992. Gillnet effort was only reduced 12% from the previous year and, although Div. 3M is still the major fishing ground for this component of the Portuguese fleet, gillnetters usually operating on Flemish Cap diverted part of their effort to Div. 3N in June/July, continuing to increase substantially their effort in Div. 3O.

Due to different spatial distribution of the most important stocks for the Portuguese fleets, associated to an increase search for unregulated species such as Greenland halibut, Portuguese fisheries continued to move towards deep sea. As for the depth distribution of trawl catches, maximum depths for cod were observed from February to May in Div. 3N, down to 1330 m/ 1450 m, and for American plaice on May in Div. 3M at 740 m/923 m.

The nominal catches and effort for 1992 are presented in Tables 1 and 2, by gear and division.

B. Portuguese Annual Sampling Program.

1. Introduction.

During 1992 only stern trawlers were sampled (two), since the last Portuguese side trawler in the NAFO area, monitored over the last three years, made its last trip in 1991. These trawlers were fishing in Divisions 3L, 3M and 3N, one from February to June and the other from March to August. Two gillnetters were also sampled, one fishing mainly in Div. 3N from May to August and the other mainly in Div. 3M from May to October.

For the four vessels sampled, catch and effort data were collected as usual through direct daily consultation on board of the captain's log-book records. Biological sampling was conducted according to the NAFO Sampling recommendations, for the most abundant species in each haul. Length compositions have been recorded for the first time for species like rough-head grenadier and red hake, and otoliths have started to be collected for redfish and Greenland halibut in an attempt to establish ageing routines for these species/stocks.

Effort data obtained through this sampling program have been processed in order to estimate the 1992 total Portuguese effort in the NAFO standard effort units, using the fishing days reported each month for each division by the Portuguese trawl and gillnet fleets. These effort daily data from the sampled vessels have also been broken down to directed effort for the target species of each month and division and associated to the correspondent catches to get the monthly cpue's observed during 1992.

Redfish mentella continues to dominate the redfish catches in all divisions and so, for the redfish fishery in Div. 3M, catch at age is derived from the *S. mentella* age/length key of the July 92 EEC cruise. The same occurred with the 3M American plaice catch at age from trawl, due to the poor age sampling of this catch.

Age composition of the 3L American plaice trawl catches is presented for the first time. Ageing of this species/Division usually presents some difficulties in the interpretation of the otoliths and is susceptible of future adjustments.

In order to assess the impact to the cod stocks of trawling for redfish and Greenland halibut, cod by-catch rates have been computed for these two fisheries in each month and division.

The intensity of sampling during 1992 is presented in Table 3, by month/ gear /species and division.

2. Comments on catch and effort data (from the trawlers and gillnetters sampled).

Division 3L.

The trawl cod catch rates have been kept at a high level since 1990, although a slight decrease is observed from 1991 (1.015 ton/h) to 1992 (0.964 ton/h). Trawl directed effort to cod halved in 1992 and the fishing season concentrated in April and May, although the highest catch rate is from March (1.8 t/h). 93% of the directed trawl effort to cod occurred at depths below 400 m.

Directed trawl effort to American plaice, first recorded in 1991, almost doubled in 1992 and the catch rate increased from 0.21 t/h in 1991 to 0.43 in 1992, during the same season as the previous year (February/April).

Redfish trawl catch rates continued to decline, going down from 0.46 ton/h in 1991 to 0.28 ton/h in 1992, despite a second consecutive fall of the directed effort to 22% of the 1991 value. Almost all the hauls to redfish were below 400m, with an average cod by-catch rate of 4.2%.

A decline of the same magnitude is observed in the Greenland halibut catch rates, where a mean value of 0.28 ton/h is recorded in 1992, against the 0.42 ton/h of 1991, for a similar fishing season (February/ June) in both years. Nevertheless directed trawl effort almost tripled from 1991 to 1992. Cod by-catch rate in this fishery averaged 2.0%.

Division 3M.

Altough for trawl in Flemish Cap redfish was still in 1992 the major target species, its directed effort declined to 27% of the previous year, all of it deployed at depths greater than 400 m. Catch rates, that have been steadily around 0.58 from 1989 to 1991, increased in 1992 to almost the double reaching 1.1 ton/h. Cod by-catch rate bellow 400m, that remained constant around 9% in 1990 and 1991, almost vanished in 1992 with an average value of 0.4%.

Trawl directed effort for cod jumped from a level near zero observed in 1991 to a level aproaching the redfish fishery. Catch rates tripled from 0.449 ton/h on 1991 to 1.419 in 1992. The majority of the cod effort was applied on June and July at bottoms above 400 m. Oposite trend is shownned by the gillnet cod fishery, exploiting the adult component: the mean catch rate of 1992 was 4.3 kg/net/day against 8.8 kg/net/day recorded on 1991, while gillnet effort declined 27% from 1991.

Division 3N.

Greeland halibut was the main target species for trawl in 1992, with a directed effort nine times greater than 1991 and spread from February to August. Catch rates doubled from one year to the other (0.193 ton/h in 1991 and 0.402 ton/h in 1992) and were distributed from Lat. 43° 36' N to 45° 57' N and Long. 47° 43' W to 49° 06' W, with a cod by-catch of 1.6%.

Skate appeared with the second highest directed trawl effort, although around 70% of it was concentrated on June. There was no effort directed to skates on 1991, but the catch rate for 1992 was 0.53 ton/h, well bellow the 1.391 ton/h recorded on 1990 for a similar level of directed effort.

Redfish directed effort for trawl fall to 20% of the 1991 one. Average catch rate records a slight increase of 10%, from 0.287 ton/h in 1991 to 0.317 ton/h in 1992. Most of the redfish effort occurred at depths bellow 400m, on January and February, with a cod by-catch rate of 7.5%.

Trawl directed effort for cod also declined to one quarter of the previous year, but catch rates increased 40% from 1991, averaging 0.376 ton/h. Cod effort is distributed from February to May, the majority of it (65%) bellow 400m. As for cod catch rates from gillnets they declined 20% from 1991 and remained at the level observed at 1990 (around 7kg/net/day). Fishing effort increased 30%.

American plaice almost didn't occurred as a target species on 1992, recording only 12% of the 1991 directed effort, concentrated on February. Catch rates declined from 0.335 ton/h on 1991 to 0.210 ton/h on 1992.

Yellowtail flounder was not observed on 1992 in the flatfish catches of the trawlers sampled.

3. LENGTH AND AGE COMPOSITION

Division 3L.

Cod trawl catches in Div. 3L were dominated by the 1989, 1988 and 1987 year classes, with lengths between 30cm and 44cm. The mean weights at age in 1992 were similar to the ones recorded in 1991.

Red fish catches for trawl in Div. 3L were mainly from 22cm to 35cm, with a mode for both sexes at 27cm. Mean lengths and weights in the catch increased from 1991, for males and females.

Catches of Greenland halibut, also from trawl, were composed of lengths between 34cm - 50cm for males and between 32cm - 53 cm for females, with modes at 36cm and 40cm respectively. Length distributions, modal lengths, mean lengths and mean weights in the catch declined in 1992 from the 1991 values, which in turn were smaller than the ones observed in 1990.

As for American plaice, ages 7 (females) and 8 (males) were the most abundant in the trawl catches, that ranged from 24cm to 38cm and 26cm to 42 cm respectively. Length modes on both sexes were at 32cm - 34 cm. Length distributions and mean weights in the catch declined from the previous year.

Division 3M.

Biological information for cod in Div. 3M came from both trawl and gillnet catches, mainly sampled on June and July. Trawl catches were dominated by the 1990 year class followed by the ones from 1989 and 1988, with lengths between 27 cm and 42 cm. From the EEC survey series on Flemish Cap, which started in 1988, the 1990 year-class is the most abundant year-class ever recorded at age 1. Comparing August 91 with July 92, mean weights at age from trawl suffered a general decline.

Most of the gillnets cod catches were composed of lengths from 57 cm to 70 cm with the 1985 and 1986 year classes dominant. Mean weights at age showed a slight decrease for these ages from 1991 to 1992 that can be attributed to a high level of sampling during the 4th quarter of 1991.

For the redfish from trawl, lengths from 26 cm to 36 cm were the bulk of the catches, both for males and females with the 1984 and 1983 year classes dominant, followed by the 1982 one (ages 8, 9 and 10 respectively). Mean weights at age remain the same on both sexes as on 1991, while the mean weight in the catch presents a slight increase.

The gillnet redfish catch was mainly composed of individuals with lengths between 26 and 38 cm for males, with one mode at 27 cm, and between 26 cm and 42 cm for females with two modes, one at 28 cm and another at 38 cm - 39 cm. Most of this catch is spread evenly through ages from 8 to 17 years old, with the mean weights at age remaining constant or showing a slight increase.

For Greenland halibut 3M, trawl catches were weakly sampled. In addition, biological information on gillnets is available for the first time. Trawl catches ranged from 38 cm to 54 cm for males and 40 cm to 60 cm for females, both sexes presenting a modal length at 44 cm.

Length composition of the Greenland halibut gillnet catches, sampled from August to October, presents males between 44 cm and 54 cm, and females from 42 cm to 60 cm, both with a mode at 48 cm.

The American plaice information for the Div. 3M catches refers mainly to the gillnet fishery, sampled from June to October. Length distributions are quite different for each sex, with males ranging basically from 26 cm to 42 cm while female catches concentrate on the 40 cm - 52 cm range. Identical mean weights in the catch are observed in 1991 and 1992. Age 6 males were the most abundant followed by ages 7 and 5. Female catches were clearly dominated by the still strong 1979 year-class (with 46 cm-50 cm), followed by the 1986 one.

For the American plaice trawl catches the biological information available is weak but points out to maintenance of the 1986 year-class as the most abundant on catches of both sexes.

DIVISION 3N

Cod trawl catches, sampled from February till May, were mainly composed of fish with lengths between 27 cm to 57 cm, with the 1989 year class continuing to be dominant, followed by the 1988 one. Most of the lengths of cod from gillnets are in the 60 cm-110 cm intervals, with the 1981 and 1982 year-classes being by far the most abundant.

Mean weights at age are quite similar for trawl and showed a slight increase in the dominant year classes of gillnets when compared to 1991, although sampling has been concentrated mainly on the first and second quarter in 1992, and on the second and third quarter in 1991. For both trawl and gillnets either the lower and upper limits of the lengths distributions, the modal lengths and the meanweights in the catch increased from 1991 to 1992.

Catches of redfish came only from trawl and were sampled during February, March and May. Both male and female length frequencies are higher within a range from 20 cm to 32 cm, with two modes for males at 23 cm - 25 cm and 29 cm - 31 cm and one mode for females at 23 cm - 24 cm. Length ranges and mean weights in the catch are identical to the ones observed in 1991.

Greenland halibut length composition is available for trawl catches sampled from April to August. Most of the male lengths fall in the 38 cm - 50 cm interval, with a mode at 44 cm, and females in the 32cm - 58 cm interval, with a mode at 42 cm. Length ranges are similar to 1991 although the mean weight in the catch showed a small increase.

For American plaice, lengths between 22 cm and 42 cm for males and 24 cm and 46 cm were the bulk of the trawl catches, the males with one mode at 34 cm and the females with modes at 28 cm-30 cm and at 34 cm. The 1985 year-class was the most abundant for males and females from trawl. Although the mean weight in the trawl is similar to the previous year, mean weights at age of males and females declined. On the gillnet catches the 1983 year-class for males and the 1984 for females were modal and for both sexes ages 7 to 11 are well represented.

Catches of yellowtail flounder only appeared in the gillnetters sampled on Division 3N. Both for males and females the 1985 year-class was dominant corresponding to modal lengths of 32 cm for males and 34-36 cm for females.

4.4 OTHERS

Some information on the witch flounder trawl catches is available for the 3 Divisions 3L, 3M and 3N. For Div. 3L lengths ranged from 42 cm to 56 cm for males and 36 cm to 58 cm for females, with modes at 48 cm - 50 cm and 46 cm respectively. Length interval for trawl catches in Division 3M were of 36 cm - 52 cm for both sexes, with two distinct modes for males at 38 cm and 44 cm, and the length groups of 40 cm to 44 cm forming the bulk of the female catches. For Div. 3N a higher upper limit of length distribution of the majority of the trawl catches is observed with witch flounders of both sexes going up to 58 cm, males recording modal lengths at 46 cm - 48 cm and females at 44 cm - 46 cm. Gillnet witch flounder catches on Division 3M present modes at 40 cm and 48 cm on males and 42 cm and 50 cm on females.

Finally information on Roughead grenadier length composition came from the trawl catches in Div. 3N, with two modes both for males and females at 17 cm and 29 cm. Length measurement refers to the anal length.

TABLE I : PORTUGUESE NOMINAL CATCHES (mt) IN NAFO AREA, 1992

SPECIES	DIVISION								TOTAL	TOTAL	TOTAL	TOTAL	TOTAL

APPENDIX

COD, divisions 3L, 3M, 3W and 3O

$$\log w = -5.2106 + 3.034 \log l \quad (\text{Hodder, 1964})$$

REDFISH, divisions 3L, 3M, 3W and 3O

$$\begin{aligned} & \text{males } w = 0.01659 * l^{2.9548} \\ & \text{females } w = 0.01372 * l^{3.0210} \quad (\text{Power and Atkinson, 1990}) \end{aligned}$$

AMERICAN PLAICE, divisions 3L and 3N

$$\log w = -5.080 + 3.041 \log l \quad (\text{Pitt, 1978})$$

division 3M

$$\begin{aligned} & w = 0.00477 * l^{3.2129} \\ & \quad (\text{Vazquez, 1992}) \end{aligned}$$

GREENLAND HALIBUT, divisions 3L, 3M and 3N

$$\begin{aligned} & w = 0.002184 * l^{3.3454} \\ & \quad (\text{Bowering and Stansbury, 1984}) \end{aligned}$$

YELLOWTAIL FLOUNDER, divisions 3N

$$\log w = -5.434 + 3.443 \log l \quad (\text{Pitt, 1978})$$

WITCH FLOUNDER, division 3L, 3M, and 3N

$$\begin{aligned} & w = 0.001083 * l^{3.4970} \\ & \quad (\text{Bowering and Stansbury, 1984}) \end{aligned}$$

ROUGHHEAD GRENADIER, division 3L, 3M and 3N

$$\begin{aligned} & w = 0.15 * l^{2.84} \\ & \quad (\text{Anon.}) \end{aligned}$$
