SCIENTIFIC COUNCIL MEETING - SEPTEMBER 1995

Biomass Estimate of the Northern Shrimp Stock on Flemish Cap  
(Division 3M) for 1993 and 1994

by

Árni Nicolajsen

*Fiskirannsóknarstovan, Fisheries Laboratory  
Nóatún, P.O.Box 3051, Tórshavn, Faroe Islands*

### Introduction

Since May of 1993 a commercial fisheries for shrimp has been going on in the Flemish Cap (Div 3M) area. In the period May 1993 to August 1995 Faroese Vessels have caught about 19091 t in this area (Tab. 1). By and large, the weekly catches have fluctuated between 20 t and 60 t. Catches as reported each week to the Faroese Fishing Administration are presented in Tab. 2 and Fig. 1.

The following assessment is based on Faroese logbook data and is made in the same way as in two previous papers assessing this stock (Á. Nicolajsen, 1993 and 1994).

### Material and method

This area swept assessment is based on 4754 recorded hauls by Faroese shrimp vessels in the period May 1993 - September 1994 which for each haul have information on date, time, position, towing time and shrimp catches. The hauls were grouped into squares of 10 degrees longitude and 7.5 degrees latitude. The material is divided into the years 1993 and 1994. Geographical distribution of number of hauls for each year is shown in Figs. 2 and 3.

Density is calculated by dividing catches by the area swept. The area swept is calculated as towing time times the average towing speed (2.75 nm/h) times the assumed effective width of the trawl (42 m). The biomass is calculated as area of square times density.

### Results

Results of the calculations are shown in Table 3. Density in each square for 1993 and 1994 is presented in Figs. 4 and 5. In 1993 the average density was 2.03 g/m<sup>2</sup> and dropped to 1.24 g/m<sup>2</sup> in 1994. When squares with less than 5 hauls are left out, the biomass for 1993 was calculated as 23953 t compared with 14589 t for 1994. Biomass by squares for 1993 and 1994 is shown in Figs. 6 and 7.
