SCIENTIFIC COUNCIL MEETING - JUNE 1996

Marine Environment Data Service Report for 1995

by

G.F. Glenn

Marine Environmental Data Service (MEDS), Dept. of Fisheries and Oceans, 12th floor, 200 Kent St.,
Ottawa, Ont. Canada K1A 0E6

Abstract

An inventory of environmental data collected in the NAFO area, is contributed annually by MEDS to the NAFO subcommittee for the environment (STACFEN). This year's report (June 1996), is for the calendar year of 1995. The inventory shows that the data traditionally reported in this series, has been collected in quantities comparable with that of the past years. Also three developments relevant to NAFO environmental/ecosystem studies have come about. The United States has begun a survey in the Georges Bank. JGOFS has produced data for the Gulf and coastal areas. And, MEDS has quality assured and archived the historical set of CTD data delivered by BIO.

Introduction

MEDS (Marine Environmental Data Service of Canada) has been recognized since about 1975 as the Regional Environmental Data Center for ICNAF and subsequently for NAFO. As the regional center, MEDS is required to report on these data annually at the June Meeting of the Scientific Council. In order for MEDS to carry out its responsibility of reporting to the Scientific Council, the Designated National Representatives selected by the Environmental Subcommittee are requested to provide MEDS with all marine environmental data collected in the Northwest Atlantic for the preceding years.

Provision of a meaningful report to the Council for its meeting in June 1996 required the submission to MEDS of a completed oceanographic inventory form for data collected in 1995, and oceanographic data pertinent to the NAFO area, for all stations occupied in the year prior to 1995. The data of highest priority are those which occupied standard sections and stations, as described in ICNAF Selected Papers, No. 3, 1978, (pages 109-117).

MEDS contributes to the knowledge of the environmental conditions of the Northwest Atlantic Fisheries, by collecting, processing, and distributing to scientists, oceanographic observation data. In this past year, data has been received by MEDS, for the NAFO area, from NAFC, BIO, the IGOSS system, the DRIBU system and the operating network of wave measurement buoys. As well as recent cruises of these measurements, the entire BIO temperature and salinity data set has been reprocessed and archive at MEDS in the past year. Also new data sets are becoming available which contain measurements of other ecosystem parameters, such as nutrients and biomass. These are being collected under the Canadian Joint Global Ocean Flux Study (JGOFS), and the U.S. GLOBEC Georges Bank Project.

The sections of this report, describe what data MEDS has been aware of, and to what extent these data have been made available to scientists in 1995/96 for 1995 and past years.

Data Management

Data which has been formatted and archived at MEDS is available to all interested scientists, within Canada and through international data exchange agreements. Arrangements can be made for data retrieval and delivery at MEDS, by telephone (613) 990-0243; by internet e-mail to services@ottmed.meds.dfo.ca, or by writing to Services, Marine Environmental Data Service (MEDS), Dept. of Fisheries and Oceans, 12th floor, 200 Kent St., Ottawa, Ont. Canada K1A 0E6.

Some data, and explanatory documentation about NAFO data, and other related programmes, is being put on the Internet through World Wide Web (WWW) servers. The WWW locations given in the references section of this report, are new in 1995-96.

Environmental Analysis of the 1995 NAFO Area

Methods of regional water climatological analysis, for the NAFO area, have evolved substantially over the past several years. In this past year, MEDS has concentrated its effort to providing complete and timely access to high quality data, for Ken Drinkwater's group at BIO, for their analysis of the region.

Conclusion

As sparse as oceanographic observations are, environmental analysis of the NAFO region is still based on the ability of an oceanographer to assimilate billions of measurements into a meaningful model of the ocean. Broad range and classical statistical methods have little value when trying to interpret these sparse observations in a prolific ecosystem. Each measurement must be scrutinised for accuracy. MEDS has been using methods developed by its computer and scientific staff to ensure that the data used in analyses, by oceanographers, is accurate and, as far as possible, complete. These procedures and software analyses have implemented much expertise under several national and international programmes, and have been accepted widely as viable methods of creating large sets of useful data.

Ocean Subsurface Data

Vertical profiles are collected worldwide with water sampling bottles, and electronic instruments. These subsurface measurements include temperature, salinity, oxygen and a wide variety of nutrients and chemicals. Derived parameters, such as sigma-t and geopotential anomaly can be computed upon request.

MEDS becomes aware of surveys of the physics and chemistry of the water column, directly: by delivery of these data to MEDS from responsible institutions and the IGOSS reporting system, and, indirectly: from Cruise Summary Reports and other reports of ocean cruise activity. Table 1 lists data collected in the NAFO area in 1995, but not yet received at MEDS. Table 2 lists data collected in the NAFO area in 1995, received at MEDS but not yet archived. Table 3(a) gives a summary of the MEDS IGOSS archive for data received during 1995. Table 3(b) gives a summary of the data received from its originator for 1995, which has been processed and archived. Table 4 lists data processed and archived, in the past year, which was in the NAFO area, but for years prior to 1995. A description of JGOFS data collected in the NAFO area follows.

Ocean subsurface data is processed at MEDS in much the same way for each of the data sets described in tables 3(a), and 3(b). Electronic files are converted from a wide range of formats, into a common Ocean's format. Quality control is carried out by a combination of specially designed software and trained personnel. The quality control has four main functions. The first is to check and ensure that each data message is properly formatted. The second is to identify duplication, and select the best version of a message, based on data type, source of the data, and general qualities in analysis and reporting of the observations. The third check, identifies and if possible, corrects, the date/time and geographical positioning information of each message, using computer tests and visual inspection of the track for each cruise. The final quality control procedure, uses a series of algorithms to find and flag, common instrument failures found in profiles of subsurface measurements. Each subsurface profile, of temperature, salinity and other subsurface constituents, is also visually inspected using software to plot the data, and allow a technician to set quality flags to individual points on a profile.

The tables showing summaries of data, list over 30,000 stations for the NAFO area. Much of the data MEDS has been aware of, for 1995, has been processed and made available to scientists conducting environmental assessments of the NAFO area. These show station locations, as found in MEDS archives, for each of the four seasons.

Table 1: Data collected in the NAFO area in 1995, not yet received at MEDS.

Georges Bank GLOBEDC Cruises

The Broad-scale cruises carried out CTD, zooplankton, fish larval and acoustic surveys of Georges Bank and adjacent waters in addition to the ship's suite of meteorological measurements. On each survey cruise 50-60 stations were occupied, with thirty eight (38) of these located to provide a uniform, bank-wide coverage, and the rest of the stations located to provide a more intensive coverage in the region of the bank where larval cod and haddock are found during the cruise. The thirty eight stations are referred to as the Broad-scale core stations.

There are two types of stations defined for these cruises:

- full stations where MOCNESS1, MOCNESS10, CTD, Pump, and Bongo data are collected;
- partial stations where Bongo, MOCNESS1 and CTD data are collected.

Joint Global Ocean Flux Study (JGOFS)

MEDS is responsible for the management and archival of data collected in the Canadian JGOFS programme. Canadian JGOFS, the largest and most ambitious of Canadian oceanographic initiatives, has brought together biologists, physicists, chemists and geologists from universities and government laboratories in a concerted effort to address what is arguably the most important environmental challenge the world has yet faced - global warming. The resulting collaboration and attendant integrative approach to the science will answer many questions about how the oceans sequester carbon, and will provide an atmosphere of cooperation that will be felt in the Canadian oceanography community for decades to come.

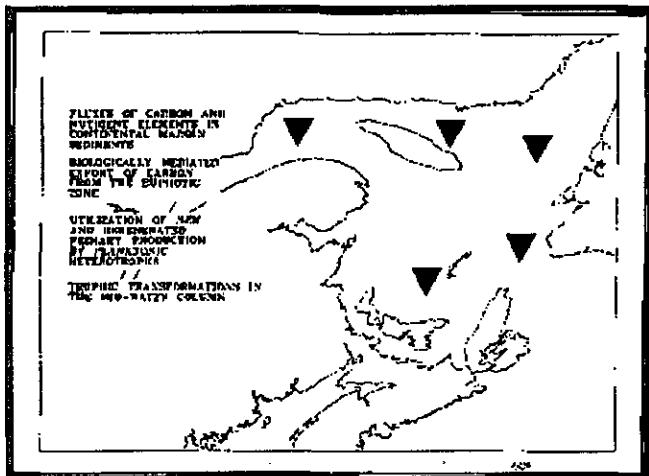

The past years have been a particularly important period in the Canadian JGOFS Program. Project science is now well established, collaboration has grown, and working groups have addressed the important issues of core measurements, data management, and ship use. Below are descriptions of four data sets within the NAFO area.

NAFO Subarea 2H, 1F (1992)

Measurements include dissolved inorganic carbon, total alkalinity, and halocarbons as transient tracers (CFC-11, CFC-12, CFC-13 and carbon-tetrachloride).

NAFO Subarea 4T, 4S, 4R, 4Vn (1992-1994) Gulf of St. Lawrence 9 Cruises to 5 sites.

Meteorology: 8 types of observations are made.

Temperature: CTD

Salinity: CTD

Fluorescence: CTD

Transmission: CTD

O₂ sensor on CTD

Bio-optical measurements: PAR profiles are collected with every CTD profile

Oxygen: bottles, no titrations on board of ship

Nutrients: NO₂, NO₃, NH₄, PO₄, SiO₂ and urea.

Carbonate measurement: Total DIC (collaboration with Mucci) and pH

Pigments: chlorophyll a by fluorometer all sampled depths; Size fractionated in the photic zone except from cruises 5 and 6

HPLC analysis from surface, chla max, 50 and 100m

HPLC analysis of copepod gut pigments, samples collected 4 times during 24 h

HPLC analysis and chl a by fluorometer from sediment trap samples

POC and PON from cruise 2 on, also on sediment trap samples

Seston from cruise 2 on, also on sediment trap samples

Primary production by C-14: for cruises 5 and 6.

since cruise 5, during cruises 1-4 the secchi disk was used; Surface PAR measurements during cruise 3 and 6

Bacterial abundance, biomass and production since cruise 4

Picoplankton cell counts and cyanobacterial abundance since cruise 4

Phytoplankton cell counts

ETS (size fractionated)

Direct plankton respiration, since cruise 5, size fractionated

Mesoplankton abundance and grazing: 3 depths (surface, mid and deep layers) at midnight and noon; defecation rates and ingestion rates

Microzooplankton abundance, since cruise 4 (only in selected depths)

Floating sediment traps: at 50 m, at all stations, since cruise 4, and 150 m (or 80 m), only at deep stations, cruises 1,5,6,7,etc.

Moored sediment traps at stations 1 and 6

ADCP, till 250 m cruises, 1,2 and 3 and till 75 m since cruise 5

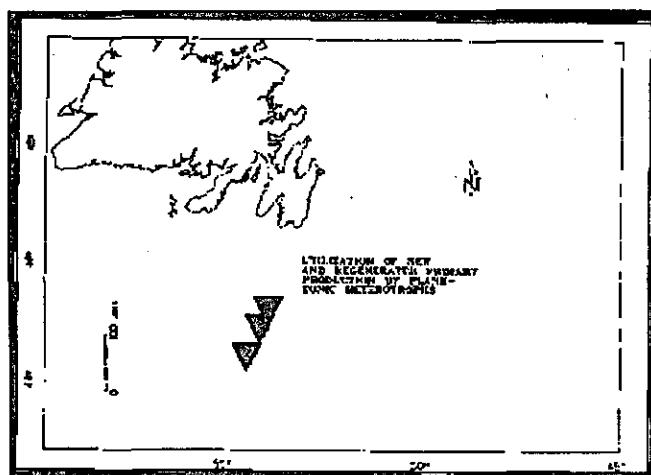

Turbulence profiler, cruise 5 and from cruise 7 on

Standard depths for sampling : 100, 50, 25, 15, 10, 1, and 0.1% light depth, 50, 75, 100, 150, 200, 250, 300, 350 m and close to bottom (depending on the depth and the station and the photic zone).

All samples are prefiltered through 200 µm mesh.

Size fractionation by filtration through 5 µm meshes and GF/F filters.

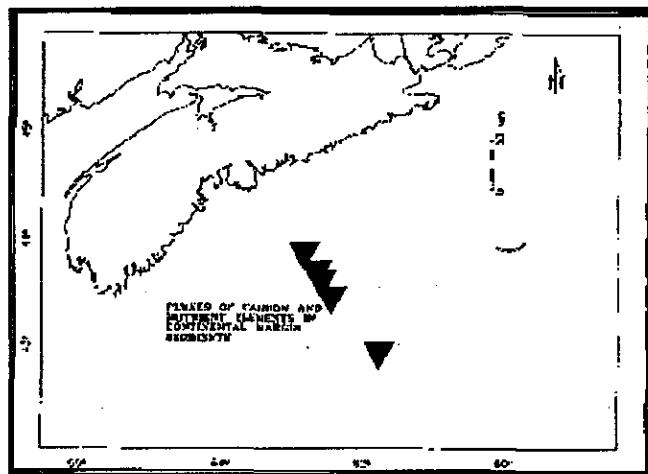

NAFO Subarea 30 (1992 - 1994)

Measurements include: zooplankton abundance and composition, zooplankton grazing, primary production,

bacterial production, biomass of phytoplankton and bacteria, nutrients, and CTD.

NAFO Subarea 4W (1992-1994)

Benthic Processes Study measurements in the Gulf of St. Lawrence (above map) and across the shelf and on the slope include: particulate organic carbon, biological populations, and a wide range of chemical species. Measurement, of radionuclides provides information on sedimentation rate, irrigation and bioturbation. Parallel studies in the laboratory are examining the kinetics of CaCO₃ dissolution and precipitation, and sedimentation and resuspension of sediment sample materials collected at study sites.

Drifting Buoy (DRIBU) Data

Drifting buoy (or DRIBU) data is received at MEDS over the GTS. Measures taken to assure its quality are much the same as those for the ocean subsurface data described above. DRIBUs report via satellite, at rates of up to every 15 minutes. These messages are for format errors, and reformatted for quality control procedures and subsequent archival. Checks, flags and possible corrections to the data are carried out by trained personnel, using a system of MEDS software which organize, analyze and display plots of the data. Quality checks use algorithms which check drifting speed and position, and ranges of sea surface temperatures and sea level pressure. The range checks include a comparison to NOAA's Ashville SST Climatology (2.5x2.5 degrees and monthly). Duplicate checking is done, and is important to discriminate between data directly from buoys and messages routed through other data centers. Lower quality data (which are this type of duplicate) are flagged as such.

MEDS as the RNODEC for drifting buoy data, has holdings of 8 million (as of 1995) DRIBU records for the world's oceans, beginning in 1978 and growing at a rate of more than one million messages per year. The message is comprised of the buoy position and some of the following parameters: surface and subsurface water temperature, air pressure and temperature, wind speed and direction.

Table 4 lists data collected by Drifting Buoys in the NAFO Area in 1995. Maps of DRIBU tracks for 1995, processed and archived by MEDS, are show in the figure.

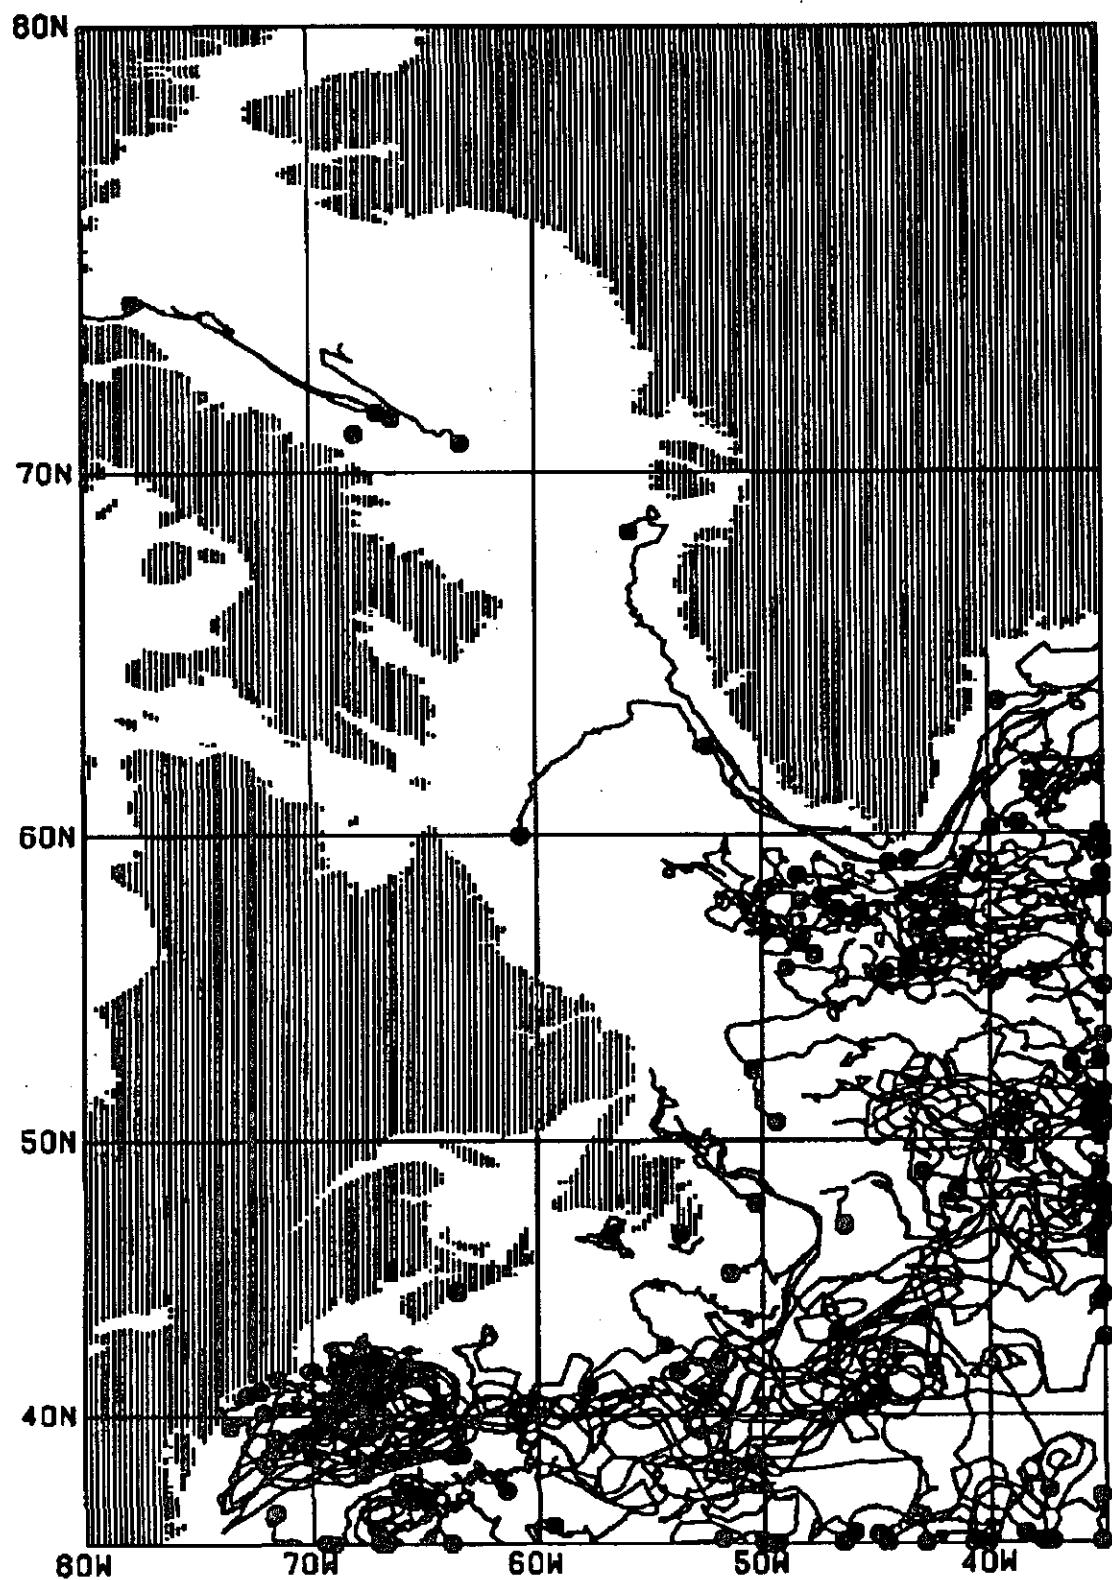

Table 5: Data Collected by Drifting Buoys in the NAFO Area in 1995
Number of Buoys = 113 and Buoy Days = 9617

1995 DRIFTING BUOYS

Current Meter Data

Current meters have been deployed in the NAFO area for many years. The Bedford Institute of Oceanography, Dartmouth, Nova Scotia collects and archives a substantial set of these observations.

Wave Data

Table 6 lists wave measurement data in the NAFO area for 1995. These data are visually inspected and using MEDS software, to set flags on data showing instrument failures. An inventory of wave data, in the NAFO area, will show many locations with a time series of data spanning many years.

Table 6: Wave spectra in the NAFO area for 1995

Total Spectra = 116725
