**Changes in Distribution and Trends in Stock Size of the Witch Flounder Resource in Divisions  
2J, 3K and 3L**

by

**Catch History**

The commercial fishery began for witch in this area in the early 1960's and increased steadily from about 1,000 t in 1963 to a peak of over 24,000 t in 1973 (Table 1; Fig. 1). Catches declined rapidly to 2,800 t by 1980 and subsequently fluctuated between 3,000 and 4,500 t to 1991. The catch in 1992 declined to about 2,700 t, the lowest since 1964, and further declined to around 400 t in 1993 (Table 1). Up until the late 1980's, the fishery was prosecuted by Poland, USSR and Canada (Table 1) primarily in Div. 3K (Table 1; Fig. 1). In recent years, the regulated fishery has been mainly Canadian although increased catches have been taken by EU (Portugal and Spain) in the NAFO Regulatory area of Div. 3L since the mid 1980's. Although only 12 t were reported for 1994, a catch of 491 t was indicated for Spain in the Spanish Research Report (SCS Doc. 95/15) for the Regulatory Area of Div. 3L. In 1995 and 1996 total catches were estimated to be about 780 and 1370 tons, respectively. However, it is believed that these catches could be overestimated by 15-20% because of misreported Greenland halibut. The catch in 1997 was estimated to be about 850 tons nearly all of which was taken in the NAFO Regulatory Area of Div. 3L.

From 1988-92, the offshore Canadian fishery was particularly successful by fishing on prespawning concentrations in the deep slopes of Div. 3K, especially in depths beyond 700 m. Between 1988 and 1993, however, the area fished had become increasingly smaller and substantially deeper. Based upon information from the fishing industry, the fishery during the winter of 1993 was very poor with the best catch rates occurring in depths greater than 1400 m. As the season progressed, catch rates quickly declined until they became too low for economic viability and the fishery was curtailed. Similar observations were made during the winter of 1994, only more extreme, which caused the catch in 1994 to be virtually nothing. No directed fishing by Canada took place since then.

The stock has been regulated by TAC since 1974 (first introduced by ICNAF) and managed by Canada within its zone since the introduction of the 200 mile national limit and has been under moratorium in recent years (Fig. 1). Because of the poor state of the stock, the NAFO Fisheries Commission agreed to extend the moratorium to the Regulatory Area beginning in 1998.

## Canadian Research Vessel Surveys

### Distribution

To illustrate the changes in spacial distribution of witch flounder over the 20 year history of the surveys a selection of graphical distribution maps (ACON plots) are shown in Figure 2. The data for the entire period has been converted from *Engel* trawl catches to *Campelen 1800* trawl catch equivalents. The overall results of the data conversion exercise is presented in Bowering and Orr (1998) (this meeting) for details. Survey distribution data from the late 1970's and early 1980's indicate that witch flounder were widely distributed throughout the shelf area in deeper channels around the fishing banks primarily in Div. 3K (Fig. 2). By the mid 1980's, however, they were rapidly disappearing and by the early 1990's had virtually disappeared from the area entirely except for some very small catches along the slope and more to the southern area (Fig. 2). The more recent results actually using the *Campelen 1800* trawl (since 1995) (Fig. 2) clearly indicate that witch flounder remain virtually absent from the shelf and channel areas. They now appear to be located only along the deep continental slope area, especially in Division 3L both inside and outside the Canadian 200 mile fishery zone.

### Biomass and Abundance Indices

Stratified-random research vessel surveys have been conducted in the fall in Div. 2J, 3K and 3L since 1977, 1978 and 1981 respectively. As indicated above, up until 1994, the surveys were conducted using an *Engel* 145' high-rise groundfish trawl whereas the 1995-97 surveys were carried out with a much more efficient *Campelen 1800* shrimp trawl. All data presented here are now in *Campelen 1800* trawl catch equivalents for 1977-94 with the actual data for 1995-97.

For Div. 2J, biomass estimates ranged from as high as 5,900 t in 1986 to a low of less than 300 t in 1994 and remained at a very low level since then (Table 2; Fig. 3). In Div. 3K, during 1979-85, there was a period of relative stability where most annual biomass estimates were near 50,000 t (Table 3; Fig. 3). Since that time estimates have declined considerably to less than 200 t in 1995, the lowest in the time series. Estimates increased slightly in 1996 and 1997 with the 1997 estimate just over 1100 tons (Table 3; Fig. 3). For Div. 3L, biomass estimates varied generally between 7,000 and 10,000 t from 1983 to 1990 but declined rapidly since then to a low of less than 400 t in 1995 (Table 4; Fig. 3). The 1996 estimate increased to nearly 1800 t, however, more than half this estimate was based on the inclusion of deep water strata (at depths of 732-1097 m) that weren't surveyed previously (Table 4). The 1997 estimate then declined to 1100 tons although there was equal coverage to that of 1996. The abundance indices followed similar trends as biomass and are shown in Tables 5-7 for Divisions 2J, 3K and 3L, respectively and illustrated in Fig. 3 by division and Fig. 4 for the divisions combined.

For the three divisions combined, there has been a very steady and rather systematic decline in the biomass index from about 65,000 tons in 1984 to under 1000 tons in 1995, by far the lowest in the time series (Fig. 4). There was some increase in 1996 and 1997 to near 3,000 tons, however, the level is still extremely low compared to the early 1980's.

### **Current Status**

The stock remains at an extremely low level with current indices of stock size based on survey trends at about 5% of the average of the early 1980's when the stock was considered at a reasonably healthy level.

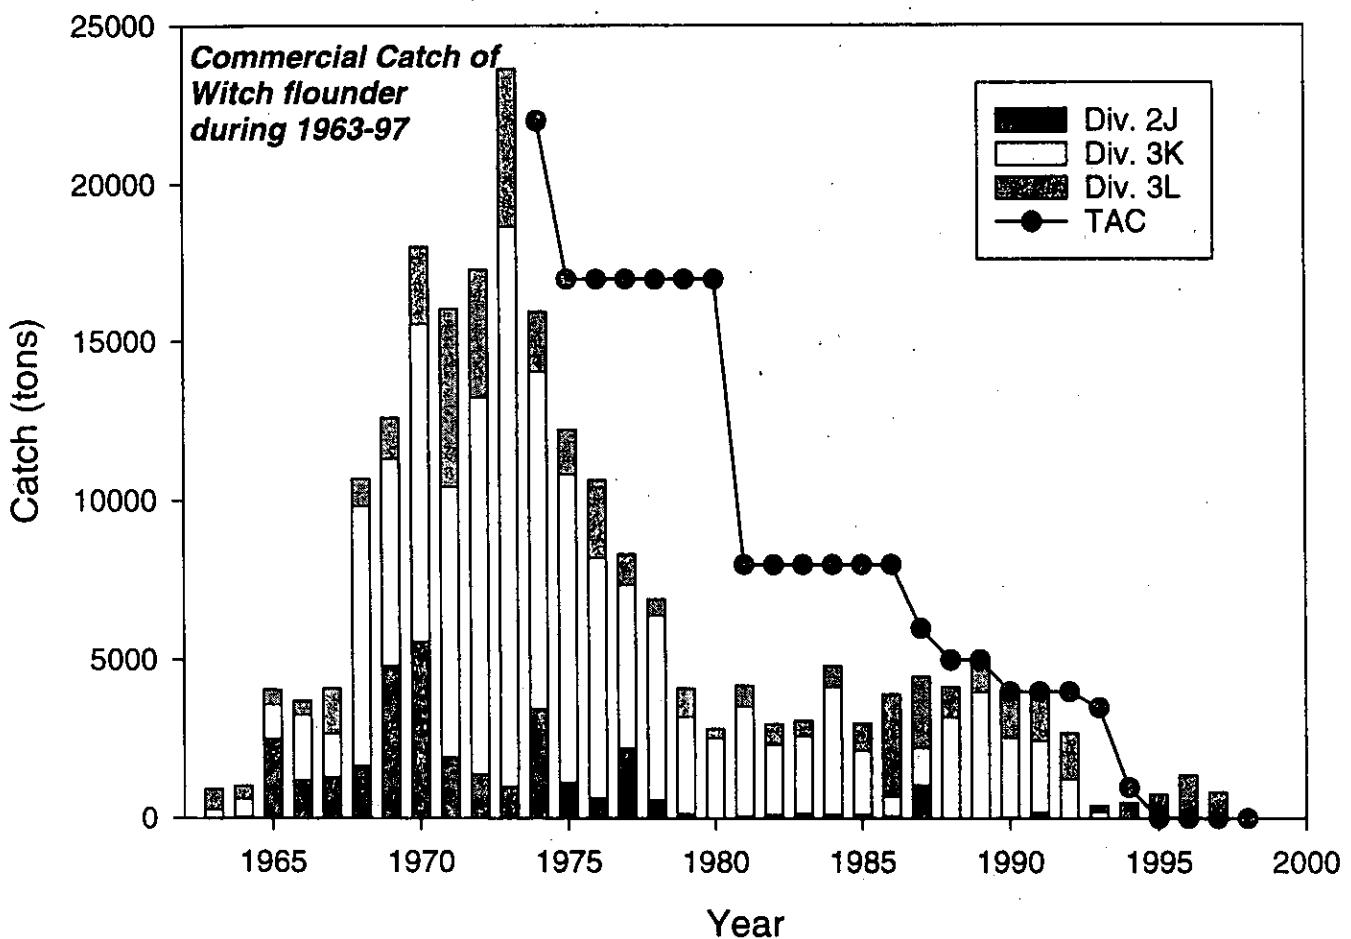

Fig. 1 Commercial catches and TAC's of witch flounder in Divisions 2J, 3K and 3L during 1963-98.

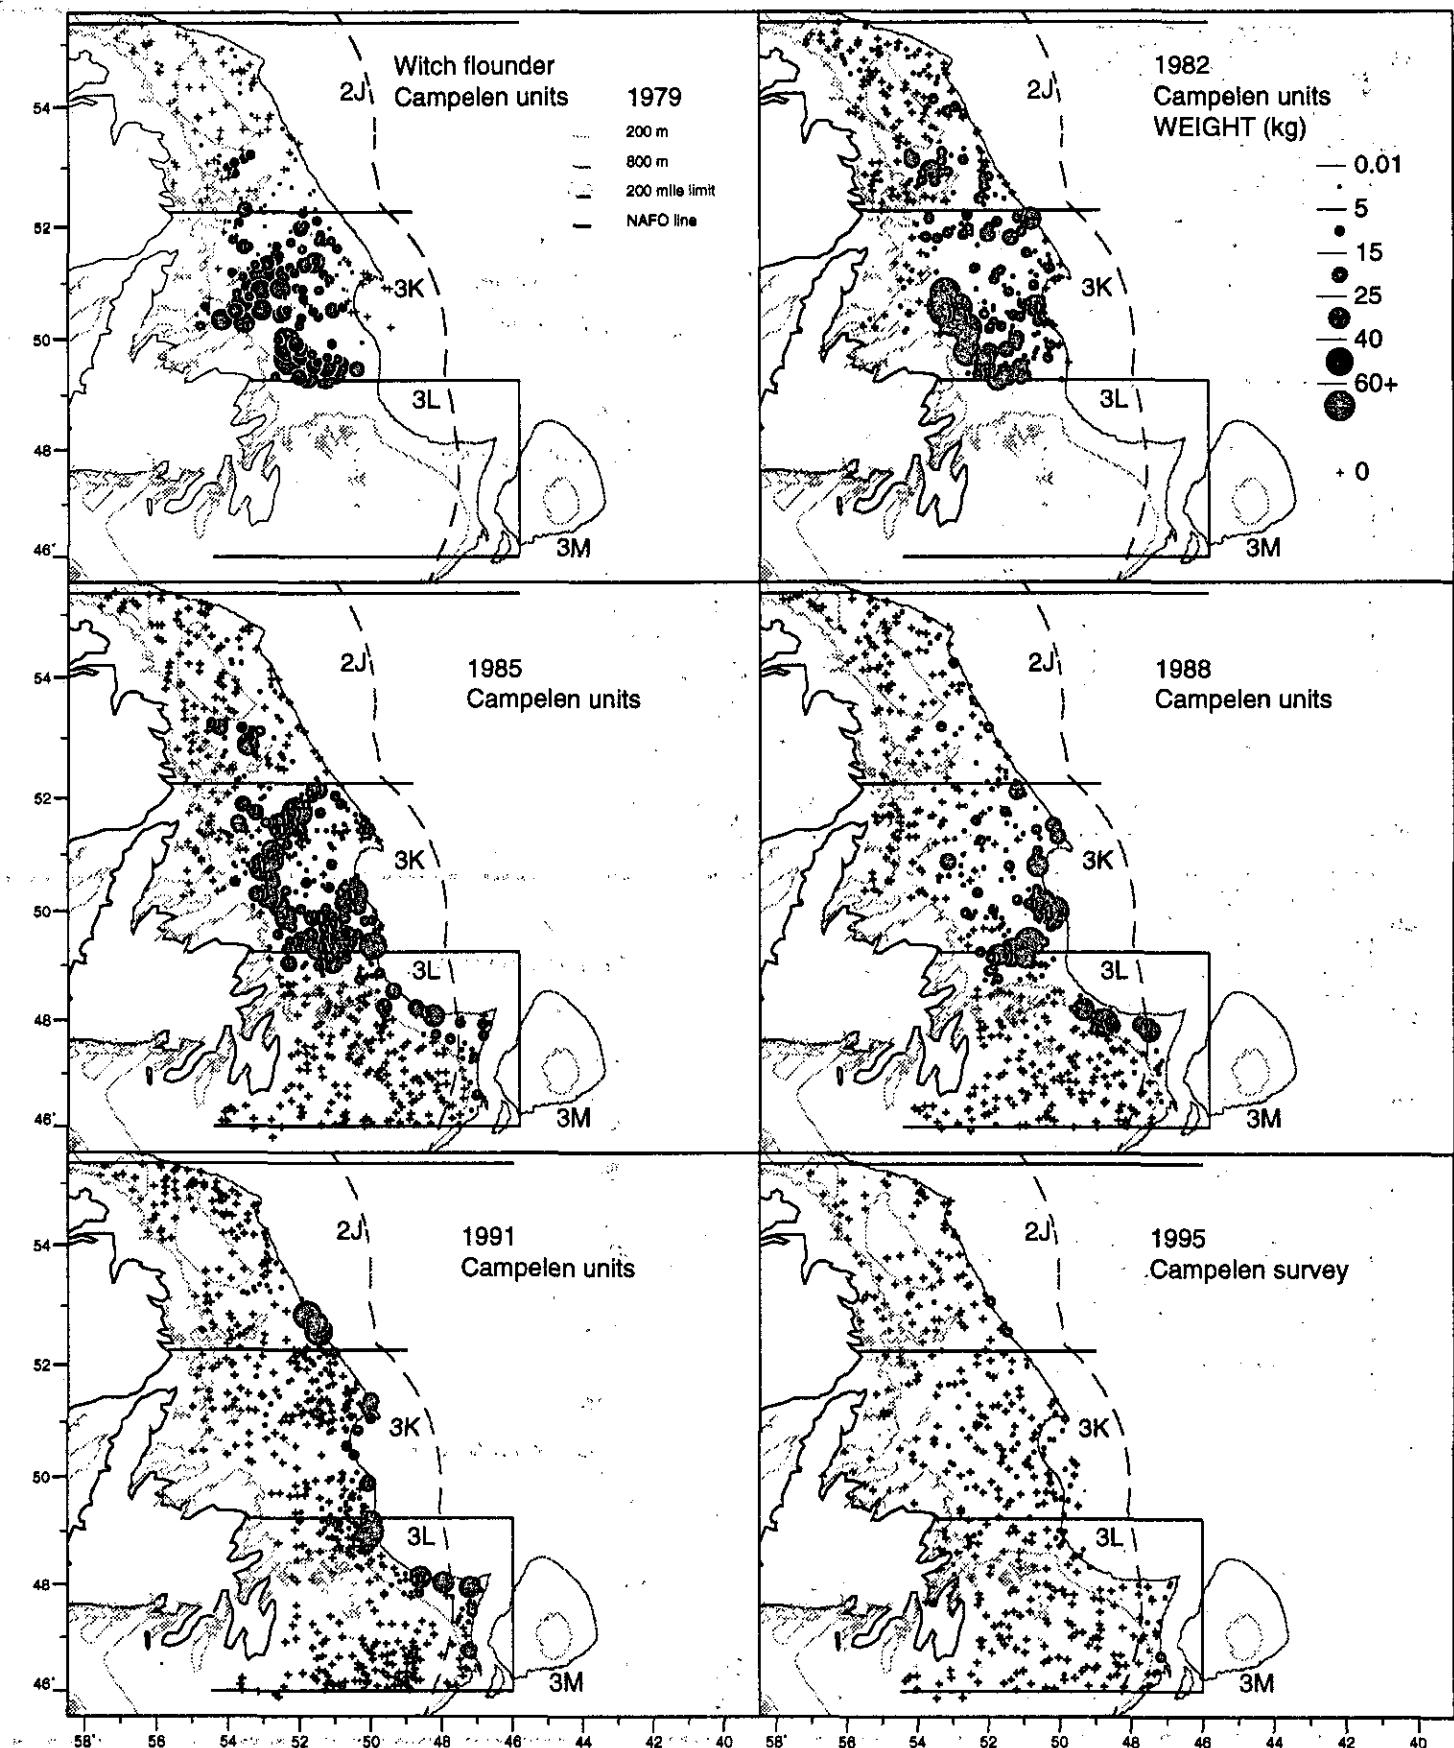

Fig. 2 Distribution of weight in Divisions 2J3KL from Canadian fall surveys for various years from 1979-1995.  
Expressed as weight (kg) per tow in Campelen units.

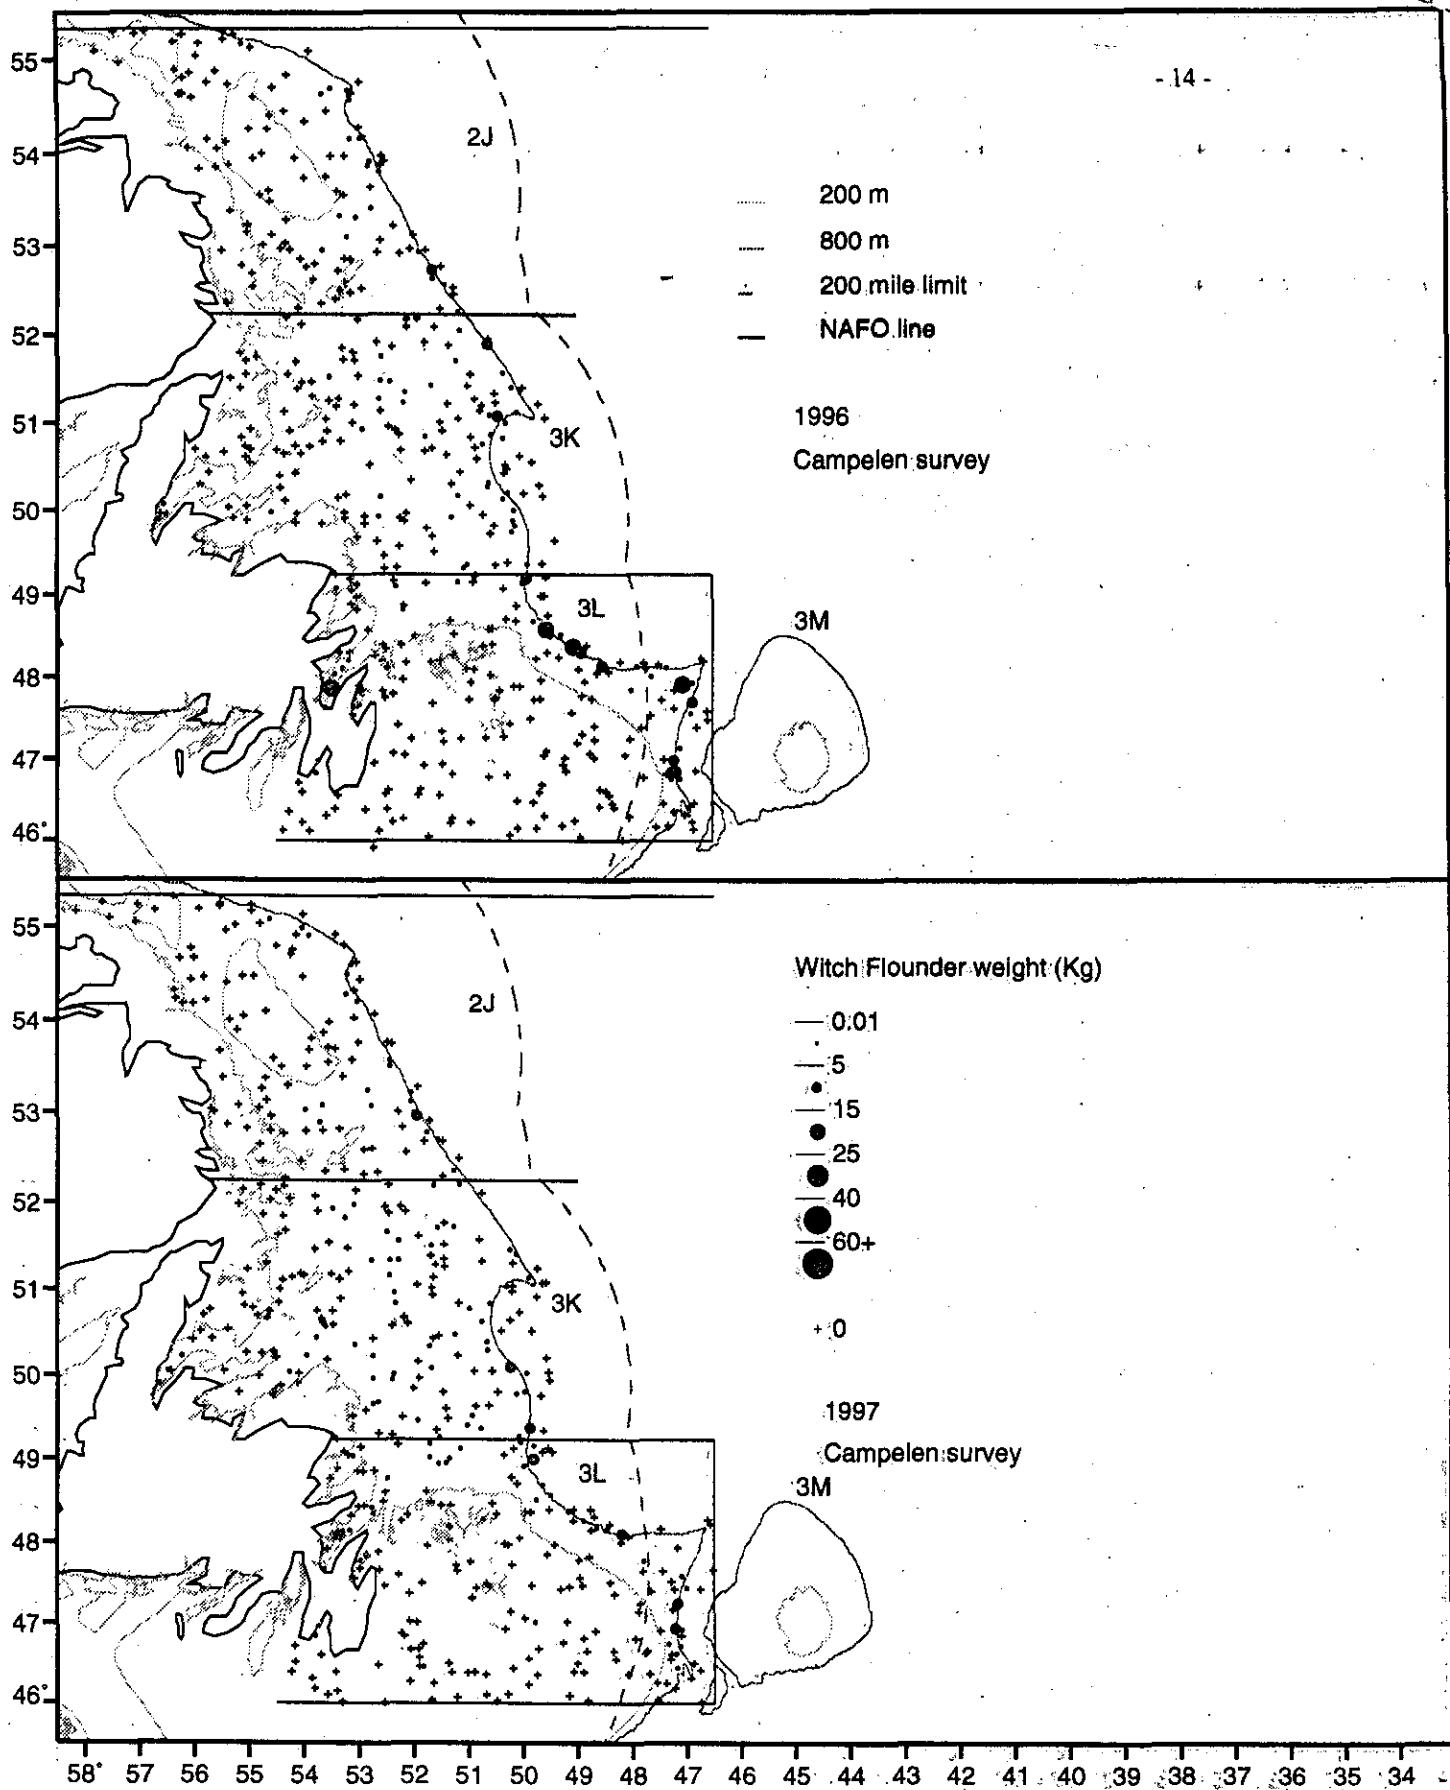

Fig. 6 Distribution of weight in Divisions 2J3KL from Canadian fall surveys in 1996-1997.  
Expressed as weight (kg) per tow using the Campelen 1800 trawl.

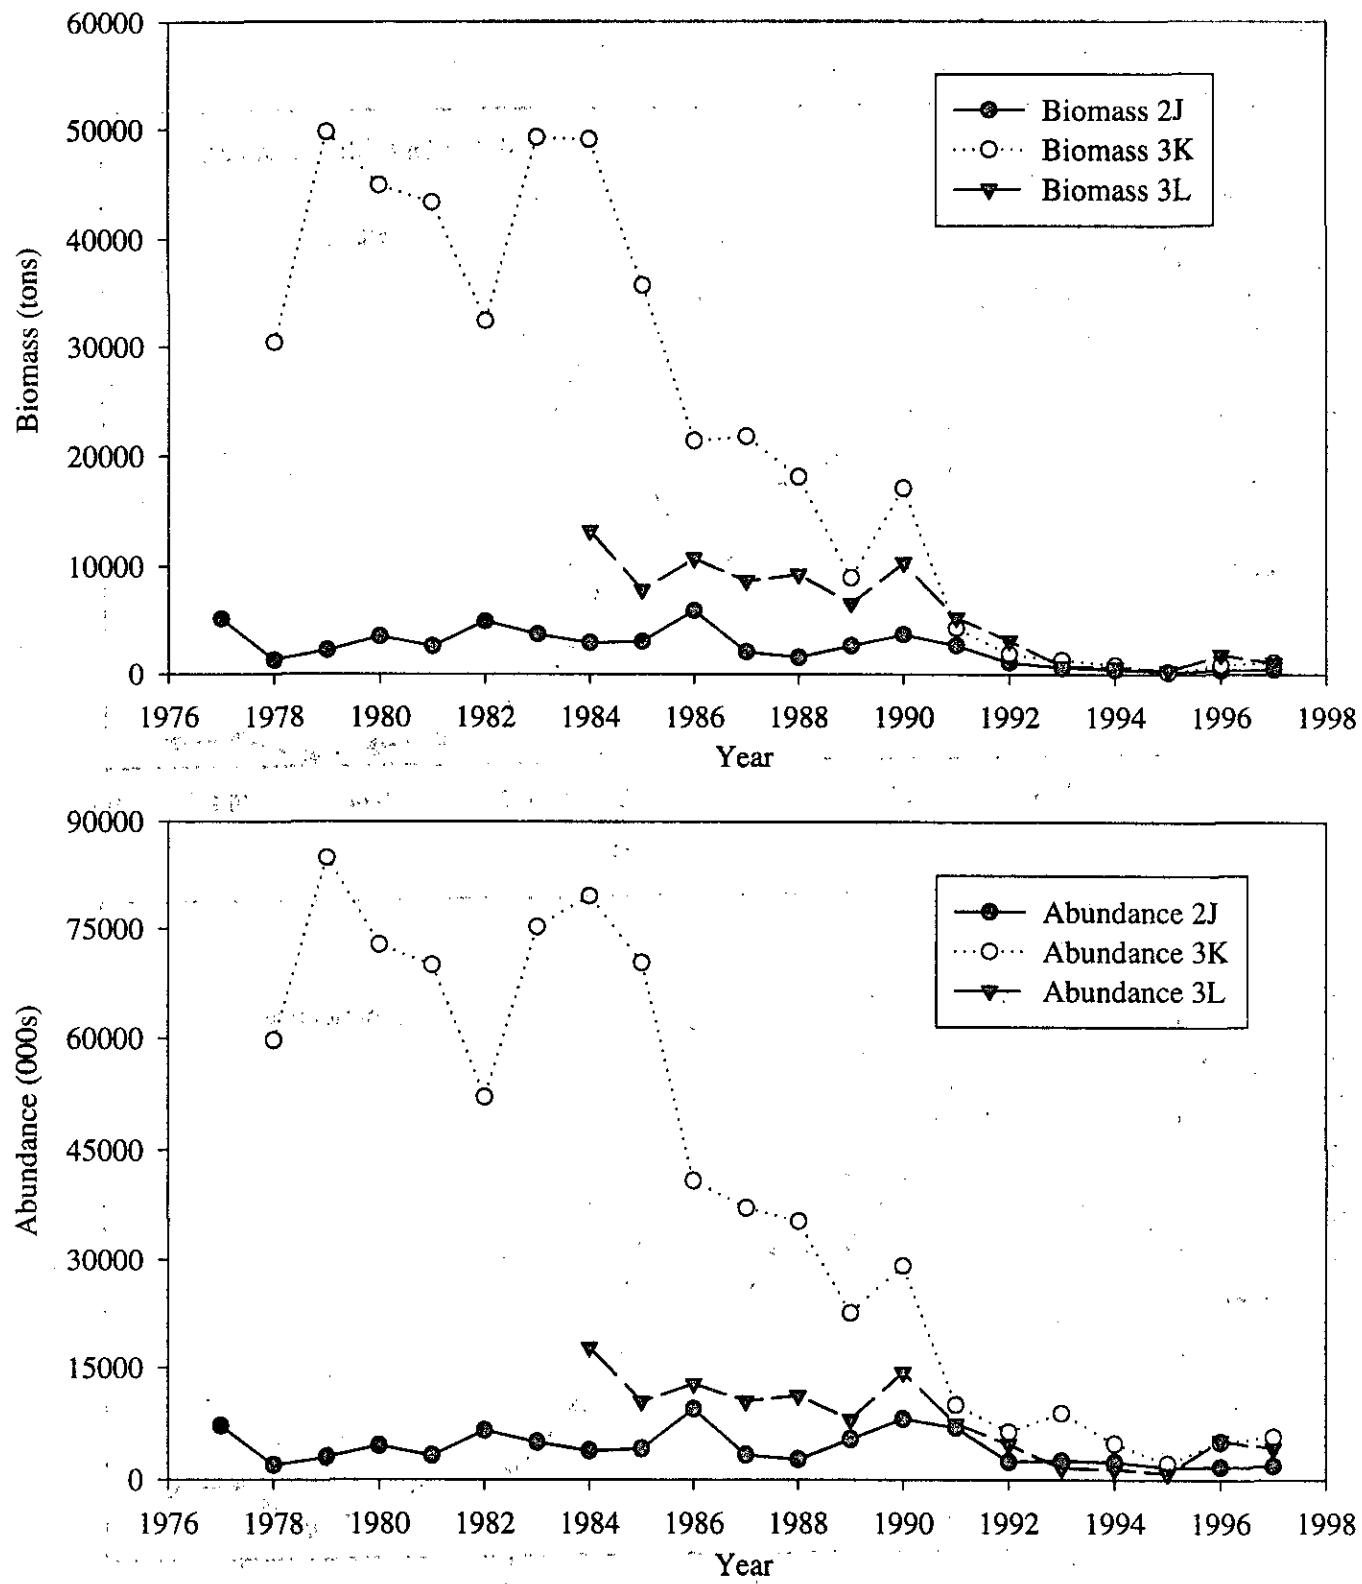

Fig. 3 Biomass (tons) and abundance (000s) of witch flounder by division from Canadian surveys in Div. 2J, 3K and 3L. Data based on Campelen trawl catch equivalents.

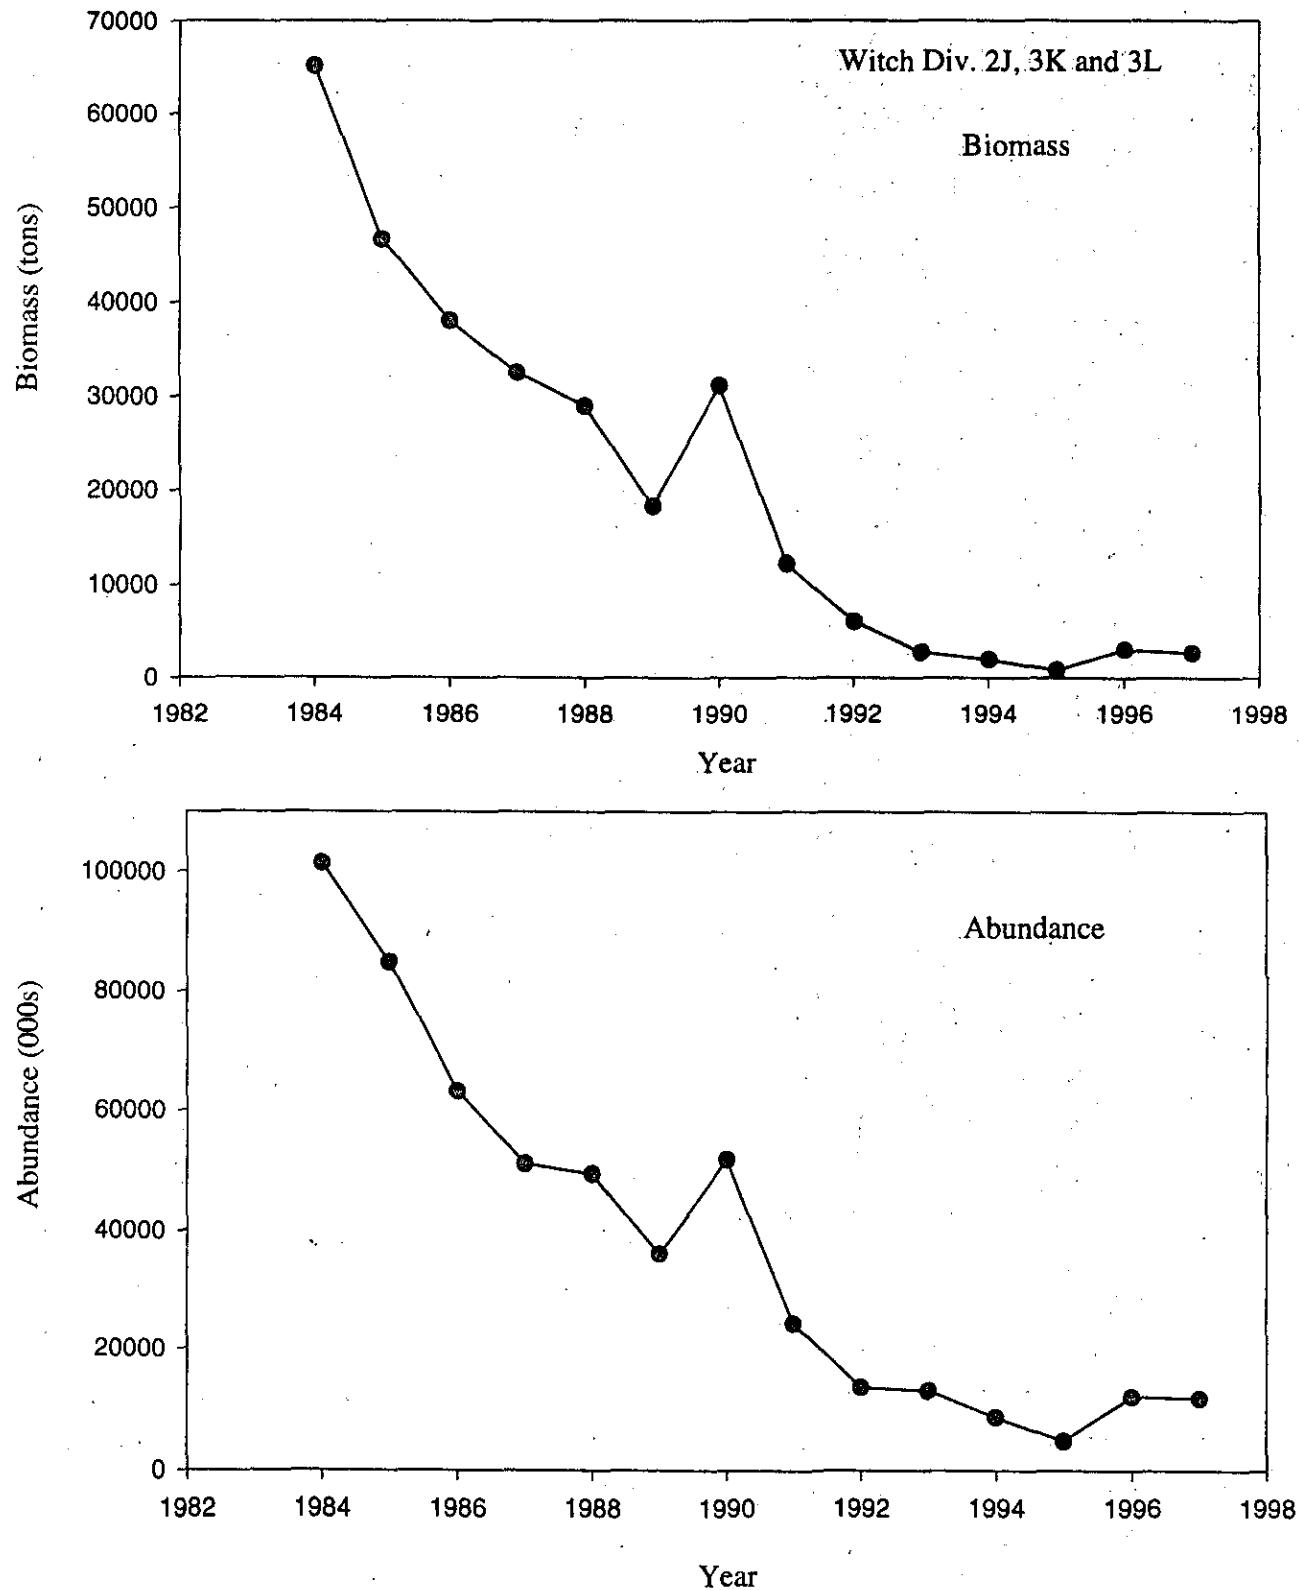

Fig. 4 Biomass (tons) and abundance (000s) of Divisions 2J, 3K and 3L combined of witch flounder from Canadian fall surveys based on Campelen trawl catch equivalents.
