SUBAREA 3

A. Status of the fisheries

The Spanish fleet fishing in NAFO Regulatory Area includes two components: the pair-trawlers, formerly fishing for cod and currently fishing for Greenland halibut, and the trawlers.

- **Pair – trawler fleet.**

In 1999 the activity of this fleet was very limited. Only two pair-trawlers have been fishing for Greenland halibut in the deep water zones (beyond 700 m) of Divisions 3LM, one in February-March and the other from April to June. One scientific observer was on board this fleet, sampling Greenland halibut and by-catch and discard species. The length distributions of Greenland halibut (May and June in Div. 3M; April to June in Div. 3L), roughhead grenadier (May and June in Div. 3M; April to June in Div. 3L), redfish (May in Div. 3L) and American plaice (April and May in Div. 3L) and an estimate of the total catch for the months with sampling in the pair-trawler fleet, are presented in tables 1 to 4 respectively. The Greenland halibut and roughhead grenadier pair-trawler catch at age for those months are presented in tables 5 and 6. Biological sampling of Greenland halibut and roughhead grenadier have been carried out by the scientific observer. This includes recording weight at length, sex-ratio and maturity stages and collecting material for reproductive studies.

- **Trawler fleet.**

In 1999, 31 trawlers have been involved in the Greenland halibut fishery, alternating with the skate fishery in the second half of the year. Four scientific observers were on board this fleet. Sampling includes Greenland halibut, thorny skate and the respective by-catch and discard species.

(1) Greenland halibut fishery.

It is performed at depths beyond 700 m. and the main by-catches were roughhead and roundnose grenadiers and *Antimora rostrata*. The unstandardized CPUEs for Greenland halibut in the period 1991 – 1999 are presented in table 7.

There are no discards of Greenland halibut, while roundnose grenadier (*Coryphaenoides rupestris*) is almost totally discarded. The estimated discard proportions of the other by-catch species were 28 % in roughhead grenadier (*Macrourus berglax*) and 10 % in *Antimora rostrata* of their respective catches. The redfish catches have been

taken at intermediate depths, mainly between 350 – 600 m. and exclusively in Div. 3N and O. The redfish catches do not overlap significantly with any other species, and the level of redfish discards is uncertain. The length distributions of the Greenland halibut, roughhead and roundnose grenadiers and redfish, and an estimate of the total catch of this fleet for the months with sampling are presented in tables 8 to 11 respectively. Those length distributions belong to the retained plus discarded catch. The parameters of the species length-weight relationships used are shown in table 12. The Greenland halibut and roughhead grenadier catches at age, referred to the estimated total catch in the months with length sampling, are presented in table 13 and 14 respectively.

(2) Skate fishery

The thorny skate fishery is performed at depths between 40 to 200 m. between September and December in Div. 3N, and the main by-catches are American plaice and yellowtail flounder. The discarding rate of skate, American plaice and yellowtail flounder was respectively 4 %, 8 % and 44 % of the total catch. The length distributions of the thorny skate, American plaice, yellowtail flounder and cod in the catches (retained catch plus discards), and an estimate of the total catch of this fleet for the months with sampling are presented in tables 15 to 18 respectively.

(B) **Research studies**

In April 1999 a selectivity survey using sorting grates have been conducted. The results with sorting grates of 35 and 55 mm were compared in the following species: Greenland halibut, cod, American plaice, witch flounder, yellowtail flounder, roughhead grenadier and redfish. A total of 54 hauls have been made, divided in two parts: one of deepwater hauls (800 – 1000 m.) in Div. 3LM (Flemish Pass), and the other in shallower waters (70 – 250 m.) in Div. 3N (Grand Bank).

In May 1999, a bottom trawl survey have been conducted in Divisions 3NO Regulatory Area. A total of 134 hauls with an stratified design have been performed, to a depth of 1450 meters. The results of this survey have been presented in SCR 99/57, which includes abundance indices and length distributions of American plaice, yellowtail flounder, witch flounder and Greenland halibut, and a comparison of the results obtained with the 'Pedreira' and the 'Campelen' gears.

In July 1999, an EU (Spain and Portugal) stratified bottom trawl survey have been made in Flemish Cap (Division 3M). A total of 117 valid hauls with the 'Lofoten' gear, and 17 with the 'Campelen' have been carried out to a depth of 711 meters. The results of this survey including abundance indices of the main commercial species and age distributions for cod, the three species of *Sebastes*, American plaice, Greenland halibut and roughhead grenadier, are presented in the SCR 00/9. Data on shrimp from this survey are presented in SCR 99/106. The results regarding the hydrographic conditions during the survey are presented in SCR 00/8. Feeding studies on the main species and collection of data and material for histological assessment of sexual maturity of cod, redfish, Greenland halibut and roughhead grenadier have also been carried out in this survey.
