SUBAREA 3

A. Status of the Fisheries

The Spanish fleet fishing in NAFO Regulatory Area includes two components: the pair-trawlers, formerly fishing for cod and currently fishing for Greenland halibut, and the trawlers.

. Pair – trawler fleet.

In 2001 the activity of this fleet was very limited as only two pair-trawler was fishing for Greenland halibut in Div. 3LM between April and June. One scientific observer was on board one of these pair-trawlers. Record of catches by species, effort, position of each haul, and biological sampling on the most important species in the catch (Greenland halibut, by-catch and discard species) were obtained. Biological sampling including recording weight at length, sex ratio, maturity stages, otoliths, and collecting material for reproductive studies were carried out on Greenland halibut and roughhead grenadier by the scientific observer. The length compositions of the Greenland halibut, roughhead grenadier, and redfish pair-trawler catches are presented in Tables 1 to 3, respectively. The age composition, mean lengths and mean weights at age of the Greenland halibut and roughhead grenadier pair-trawler catch are presented in Tables 4 and 5, respectively. The Greenland halibut catches are based mainly on ages 5 to 7 and those of roughhead grenadier on ages 6 to 10.

. Trawler fleet.

In 2001 a total of 31 trawlers have been involved in NAFO fisheries. The main fishery in NAFO area is the Greenland halibut fishery (mainly in Div. 3LM), alternating with the skate fishery in the second half of the year (Div. 3N), shrimp fishery (Div. 3M), and redfish fishery (Div. 3O). The total fishing effort of this fleet reported by the NAFO observers on board every vessel (Table 6) have been used to estimate the effort proportion directed to each one of those target species. Most part of the effort concentrates in Div. 3LM, corresponding to the northern Flemish pass fishing area. While in this area it remains almost constant over the year, a remarkable increase in effort occurred in Div. 3NO since late summer and in autumn.

The breakdown of the effort by depth and Division is presented in Table 7. In Div. 3L the fishing activity has been performed at depths beyond 600 m, indicating the fleet was targeting Greenland halibut. In Div. 3M most of the effort was carried out in the stratum of more than 600 meters depth, targeting Greenland halibut. The effort carried out, in this Division, in the stratum from 200 to 600 meters depth belongs to the shrimp fishery. In Div. 3N during the first

half of the year, the fishing activity has been performed at depths beyond 600 m, indicating the fleet was targeting Greenland halibut, but since July part of the fleet activity moved to depths less than 200 m, where the skate fishery is performed. Fishing activity in Div. 3O was limited and targeting redfish. The fishing activity in the area 1F were directed to the fishery of *Sebastes mentella*.

In addition to the NAFO observers, 7 scientific observers from the Spanish sampling program were on board this fleet. Besides recording catches, discards and effort, those observers carried out biological sampling on Greenland halibut, thorny skate and the respective main by-catch species. This includes recording weight at length, sex-ratio, maturity stages and stomach analysis, and collecting material for reproductive studies on Greenland halibut and roughhead grenadier. Otoliths of those two species are also taken for age determination.

Division 3LM

In these Divisions, the most important specie in the catches is Greenland halibut and practically all is captured in the stratum of more than 600 meters depth. The main species in the by catch of this fishery are the grenadiers (RNG and RHG), *Gaidropsarus ensis* (HKR) and skates (SKA). In the Div. 3M, besides the Greenland halibut fishery, exists a shrimp fishery that it is carried out mainly in the stratum of 200-600 meters.

Division 3NO

In the Div. 3N, most of the effort is carried out in the strata of <200 and >600 meters. In the stratum of <200 skate fishery is carried out in the second semester of the year and the main species of the by catch of this fishery are American plaice (PLA) and Yellowtail flounder (YEL). In the stratum of >600, the main specie in the catches is the Greenland halibut and the main species that compose the by-catch are the American plaice (PLA), grenadiers (RNG) and skate (SKA).

In the Div. 3O the effort carried out by the Spanish fleet is very little and most of its is carried out in the stratum of 200-600 meters. The main specie in the catches is the redfish (RED), and the main species in the by-catch of this fishery are American plaice (PLA), yellowtail flounder (YEL) and skate (SKA).

In Table 19 the percentage of the catches is shown by stratum of depth for each species and Division and Fig. 1 shows the percentages of the catches for species and division.

The length composition of the Greenland halibut, roughhead grenadier and witch flounder in the trawl catches for the months with sampling are presented in Tables 8 to 10 respectively. Those length distributions belong to the retained plus discarded catch. The parameters of the species length-weight relationships used are shown in Table 11. The age composition of the Greenland halibut and roughhead grenadier trawl catches are presented in Tables 12 and 13, respectively. Most part of the Greenland halibut catches are from ages 5 to 7 and the main part of the roughhead ones between 6 to 10. The length distributions of the American plaice, yellowtail flounder, cod and skate taken (retained catch plus discards) are presented in Tables 14 to 17 respectively. The redfish length composition in the trawl catches is presented in Table 18.

(B) Research Studies

In May 2001, a bottom trawl survey have been conducted in Div. 3NO Regulatory Area. A total of 133 hauls using a Pedreira gear with a stratified design have been performed, to a depth of 1450 meters. 92 of them have been made fishing in parallel with the R/V *Vizconde de Eza* using a Campelen gear, which replace this year the C/V *Playa de Menduña* in the performed of the bottom trawl. So, a comparative study has been developed to transform the historical series of the C/V *Playa de Menduña* (1995-2000) in the new series of the R/V *Vizconde de Eza*. The results of that comparative study are presented in SCR 02/5. In addition, 18 of the 92 hauls have been made in parallel with the Canadian Research Vessel *Wilfred Templeman*, using also a Campelen gear. The results of the Spanish 3NO bottom trawl survey for all the period studied (1995-2001), including abundance and biomass indices and length distributions of American plaice (SCR 02/2), yellowtail flounder (SCR 02/3) and Greenland halibut (SCR 02/4) are presented in SCR 02/2, SCR 02/3, and SCR 02/4, respectively.

The EU bottom trawl survey on Flemish Cap (Div. 3M) was carried out in July 2001. A total of 120 valid hauls with the usual survey gear (Lofoten) were made up to 730 meters depth. Additionally, 20 hauls were made with a Campelen gear for catchability comparisons. Survey results including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice and Greenland halibut are presented in the SCR 02/12, and for roughhead grenadier in SCR 02/18. Data on shrimp from this survey was presented in SCR 01/172 and SCR 01/189. The results regarding the hydrographic conditions during the survey are presented in SCR 02/... Feeding studies on the main species were continued, and samples for histological assessment of sexual maturity of cod, redfish, Greenland halibut and roughhead grenadier have been also taken.
