<sup>3</sup> AZTI Foundation, Pasaia, Spain

**SUBAREA 3**

**A. Status of the fisheries**

A total of 32 Spanish trawlers operated in NAFO fisheries in Divisions 3LMNO during 2002 corresponding to a fishing effort of 5.903 days (101.187 hours). Total catches for all species combined were 30.244 tons. Total effort and catches were estimated throughout the information of the EU observers on board. The best estimations of Spanish catches in 2002 are presented in Table 1 by species and Division. Table 2 shows the effort (days and hours) by quarter and Division as well as the percentage of the effort by mesh size. Table 3 shows total catches for the main species by Division and quarter.

The Spanish fishery in NAFO area is mainly directed to Greenland halibut (mainly in Div. 3LM), alternating with the skate fishery in the second half of the year (Div. 3NO), shrimp fishery (Div. 3M), and other species (Div. 3O).

In Div. 3L, the fishing activity was performed at depths greater than 600 m and using cod-end mesh size of 135 mm, indicating that the fleet targeted Greenland halibut. Regarding Div. 3M most of the effort was carried out in the strata of more than 600 m depth and using cod-end mesh size of 135 mm, also targeting Greenland halibut. Also for the same Division, the fishing effort carried out within the strata from 200 to 600 m depth belongs to the shrimp fishery using cod-end mesh size of 40 mm. In Div. 3N and during the first half of the year, the fishing activity was performed at depths greater than 600 m. and using cod-end mesh size of 135 mm, which indicates that the fleet targeting Greenland halibut. However, since July some fleet activity moved to depths less than 200 m. and with mesh size of 280 mm, where the skate fishery is performed. Fishing effort in Div. 3O was limited and targeting several species with mesh size of 135 mm and 280 mm.

In addition to those observers from the NAFO Scientific Observers Program, four observers from the Spanish Scientific Sampling Program were onboard, comprising a total of 440 days. Besides recording catches, discards and effort, these observers carried out biological sampling on Greenland halibut, thorny skate and the respective main by-catch species. This includes recording weight at length, sex-ratio, maturity stages and stomach analysis, and collecting material for reproductive studies on Greenland halibut, Roughhead grenadier and American plaice. Otoliths of those three species and caudal thorns skate were also taken for age determination.

The length and age distributions presented in this paper are based on the samplings carried out by these observers. The parameters used for the length-weight relationships by species are shown in Table 4.

***COD (Div. 3NO; Div. 3M)***

Spanish catches for this specie by Division and quarter are presented in Table 3. Main catches were taken in the Div. 3N and they were by-catch in the Greenland halibut and skate fisheries. No catches were record in Div. 3M.

Table 5 shows the Spanish length distributions samplings by month. Note that there was only one sample in July in Div. 3N.

***Redfish (Div. 3LN; Div. 3M; Div. 3O)***

Table 3 shows the catches for this specie by Division and quarter carried out by the Spanish fleet in the year 2002. Most catches were taken in the Div. 3LN as by-catch of Greenland halibut fishery.

The Spanish length distributions samplings by month in Div. 3LN are shows in Table 6, and Table 7 shows the total catches length distributions by Division.

Table 8 and 9 present the Spanish length distributions samplings by month, and the total catches length distributions for Div. 3M and 3O.

***American plaice (Div. 3LNO; Div. 3M)***

Spanish catches for this specie in 2002 are show in Table 3. Most catches were taken in the Div. 3LNO as by-catch of Greenland halibut and skate fisheries. Catches in Div. 3M reached only 35 tons and they were by-catch of the Greenland halibut fishery.

Tables 10, 11 and 12 show the length distributions of the Spanish samplings by month and Division. Table 13 shows the length distributions of the total catches for American plaice in Div. 3LNO. The Spanish length distributions samplings by month for Div. 3M are presented in Table 14.

***Witch flounder (Div. 2J and 3KL; Div. 3NO)***

Table 3 shows the Spanish catches by quarter and Division for this specie. This species is taken as by-catch of the Greenland halibut fishery. Spanish catches of Witch flounder (Div. 2J and 3KL) were taken only in Div. 3L.

The length distributions of Spanish catches by month for Div. 3L are shown in Table 15. Table 16 shows the same for Div. 3NO.

***Yellowtail flounder (Div. 3LNO)***

Table 3 presents the Spanish catches by quarter and Division for this specie. Main catches of this species were taken in Div. 3N, as by-catch of the skate fishery.

Table 17 shows the length distributions of Spanish catches by month for Div. 3LNO (only for second semester in Div. 3N).

***Greenland halibut (Subareas 2 and 3)***

Catches by quarter and Division for this specie are presented in Table 3. Greenland halibut is the main target specie for the Spanish fleet in NAFO area and most of the catches were taken in Flemish Pass area (Div. 3LM). The mesh size for this fishery is equal or greater than 135 mm.

Table 18 shows the length distributions of the Spanish total catches by Division for this specie. They were calculated quarterly for Div. 3L and 3M but they were calculated yearly for Div. 3NO since the quarterly sampling coverage was not sufficient. The corresponding age composition, mean weight and mean length by age of the Greenland halibut length distributions is presented in table 19. Most part of the Greenland halibut catches correspond to ages 5 to 8.

### ***Thorny skate (Div. 3LNO)***

Spanish catches by quarter and Division for the skates are presented in Table 3. In Div. 3LM, catches comprise three species (*Raja hiperborea*, *Raja radiata* and *Raja ferreiro*) and are taken as by-catch of the Greenland halibut fishery. Although the species ratio in catches is unknown, it could be assumed that it is the same that in Div. 3NO (i.e. 0.7%, 94.7%, 4.6%). Catches in Div. 3NO were only for *Raja radiata* and most of them came from a direct fishery for this specie. The mesh size used in this fishery was equal or greater than 280 mm.

The length distributions of the Spanish samplings by month for Div. 3L and 3N are presented in Table 20. Table 21 shows the length distributions of the Spanish total catches by Division for this species. They were calculated for Div. 3L applying the total length distribution of Div. 3L and 3N to total catches of this division. Regarding Div. 3NO, the length distribution of the Div. 3N was applied to the total catches of Div. 3NO. No samples from Div. 3M were available.

### ***Roughhead grenadier (Subarea 2 and 3)***

Table 3 shows the Spanish catches by quarter and Division for Roughhead grenadier. Roughhead grenadier is the main species in the by-catch of the Greenland halibut fishery and most of the catches are taken in Div. 3LM in the Flemish Pass area.

Table 22 shows the length distributions of Spanish total catches by Division for this specie. They were calculated quarterly for Div. 3L and 3M and for 3NO the total length distribution of the Div. 3N has been applied to total catches of Div. 3NO.

The corresponding age composition, mean weight and mean length by age of the length distribution is presented in table 23 and 24. Most part of the Roughhead grenadier catches are composed of ages 5 to 13.

## **B. Research studies**

The bottom trawl survey of NAFO Regulatory area in Div. 3NO was conducted in April and May 2002 on board R/V *Vizconde de Eza* using a Campelen gear with a stratified design. A total of 120 hauls were carry out up to a depth of 1450 m. Sixteen of those hauls were made in parallel with the Canadian R/V *Wilfred Templeman*, using also a Campelen gear. The results of the Spanish 3NO bottom trawl survey for all the period studied (1995-2002), including abundance and biomass indices, with their errors, and length distributions of American plaice, yellowtail flounder and Greenland halibut are presented in SCR 03/07, SCR 03/06, and SCR 03/08, respectively.

In 2001 the R/V *Vizconde de Eza* using a Campelen gear replaced the C/V *Playa de Menduñña*, using a gear type Pedreira, as the research vessel of the survey. A catchability comparison experiment was carry out with 92 paired hauls between both vessels. Six different methods to convert the C/V *Playa de Menduñña* abundance and biomass indices (1995-2000) into the R/V *Vizconde de Eza* indices were considered. Results are presented in SCR 03/05.

The EU bottom trawl survey on Flemish Cap (Div. 3M) was carried out in July 2002. A total of 120 valid hauls with the usual survey gear (Lofoten) were made up to 730 m depth. Survey results including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice and Greenland halibut are presented in the SCR 03/..., and for Roughhead grenadier in SCR 03/13. Data on shrimp from this survey was presented in SCR 02/150. The results regarding the hydrographic conditions during the survey are presented in SCR 03/.. Feeding studies on the main species were continued, and samples for histological assessment of sexual maturity of cod, redfish, Greenland halibut and Roughhead grenadier have been also taken.
