## SCIENTIFIC COUNCIL MEETING – JUNE 2006

Results for Greenland Halibut and American Plaice of the Spanish Survey in NAFO Divisions 3NO: Biomass,  
Length Distribution and Age Distribution for the Period 1997-2005

by

### Abstract

Greenland halibut (*Reinhardtius hippoglossoides*) and American plaice (*Hippoglossoides platessoides*) indices from the bottom trawl survey that Spain carries out in spring since 1995 in Divisions 3NO of the NAFO Regulatory Area are presented. Biomass, length distribution and age distribution are presented since 1997, year in that the survey extended the depth strata. In 2001, the R/V *Vizconde de Eza* replaced the C/V *Playa de Menduña* in the execution of the survey. We present the transformed to the R/V *Vizconde de Eza* series for the period 1997-2000, and the original obtained data for the period 2002-2005. In 2001, there are data from the two vessels. This year the data were updated, so a new calibration was made. The changes affect the species length distribution. Greenland halibut biomass and abundance estimates present a decreasing trend along the period. It seems not to be recuperation of the stock. But in last years it can be seen a presence of juveniles, mainly in 2004. For American plaice we can see an increasing trend along the whole period. For this species, a good recruitment occurred in 2004 (ages 1 and 2).

### Material and Methods

Since 1995, Spain carries out a spring-summer survey in the NAFO Regulatory Area of Div. 3NO on board the C/V *Playa de Menduña* with a net trawl type *Pedreira*. In 2001, this vessel was replaced by the R/V *Vizconde de Eza*, using a trawl net type *Campelen*. To know more details about the technical specifications of the surveys, see Walsh *et al.*, 2001 and González Troncoso *et al.*, 2004.

The catch of each haul was sorted and weighted into species and a sample of each species was taken in order to measure the length distribution. For Greenland halibut and American plaice each individual of the sample was measured to the total length to the nearest lower cm. We present the indices for the period 1997-2005. In 1995 and 1996 only the less deeper strata was surveyed, so these years are not representative for these species, thus they are not included in the analysis.

In Table 1, we present the number of valid tows, the depth strata covered and the dates of the survey series (1997-2005).

This year, errors in the length distribution data process tools were found. The changes affect both the numbers and the shape of the length distribution. A new calibration factors for the length distribution were calculated for each species following identical method employed in previous years, fitting the ratios of the number of the two vessels length by length. There is a length range in which the ratios of the data are scattered, so it seems to be better not to apply the fit to the entire length range but to cut in an appropriate point. A residual analysis was made in order to choose the best length to make the cut, or if it was better to cut or not. The new transformation factors and their graph are presented for both transformed species. The changes do not affect the mean catches and the biomass, so

these indices are the same than last years. For details about the transformation of these species, see González Troncoso *et al.*, 2004 and González Troncoso *et al.*, 2004.

For each species, all the indices are presented transformed until 2000 and no-transformed in the period 2002-2005. In the year 2001, there are data transformed from the former vessel with original data from the new vessel. We present per haul the mean catch, the stratified mean catch and the biomass with their variance per year; the length distribution in number per haul stratified mean catches per length, sex and year; and per age the age numbers, the mean length and the mean weight per haul stratified mean catches. The age numbers were calculated starting from the length distribution per haul stratified mean catches applying the Age Length Key (ALK) for age-length keys. Weight at age was calculated by applying the length/weight relationship for each year to the mean length. For Greenland halibut, Spanish ALK was applied, but for American plaice we have no ALK yet, so we have used the Canadian ALK for this species (K. Dwyer and J. Morgan, com. pers.)

## Results

### ***Greenland halibut***

#### **Introduction**

The Greenland halibut stock in Subarea and Div. 3KLMNO is considered to be part of a biological stock complex, which includes Subareas 0 and 1. Abundance and biomass indices were available from research vessel surveys by Canada in Div. 2J+3KLMNO (1978-2004), EU in Div. 3M (1988-2004) and EU-Spain in Div. 3NO (1995-2004). Commercial catch-at-age data were available from 1975-2004.

The exploitable biomass (age 5+) was reduced to low levels in 1995-97 due to very high catches and high fishing mortality. It increased during 1998-2000 due to greatly reduced catches, much lower fishing mortality and improved recruitment. However, increasingly higher catches and fishing mortality since then accompanied by scarce recruitment has caused a subsequent decline. The 2005 biomass estimate is the lowest in the series.

So, the exploitable biomass has been declining in recent years and is presently estimated to be at its lowest observed level. Recent recruitment has been below average, and fishing mortality has increased substantially in recent years, and is currently estimated as the highest in the time series (NAFO, 2005). Our results confirm these results presented by the Scientific Council last year.

#### **Mean catches and Biomass**

Table 2 shows the swept area, the tow number, the mean catches and their variance per haul and year to Greenland halibut. In Table 3 and Fig. 1 we present the stratified mean catches per stratum with the total variance per year. Table 4 and Fig. 2 present the biomass per swept area per stratum and their total variance per year, as the biomass corresponding with the ages 5+ and 10+. In Table 5 we present the length-weight relationship parameters *a* and *b*.

The biomass of the Greenland halibut has decreased since the year 1999. At this moment, the biomass is much below the level of 1997. As the Canadian data, our lowest data is in 2002. The stock seems not to recover.

#### **Length Distribution**

The result of the model proposed by Warren for Greenland halibut was the following:

$$\ln(\text{ratio}) = \exp(11.844 + 0.0556l - 4.5043\ln(l))$$

Figure 3 shows the ratios and their fit. In this figure, we observed that, although the data is a bit dispersed, in general the fit is good. So, for this species, this fit was taken for all the length range.

Table 6 presents the length distribution in number per stratified mean catch by haul for the Greenland halibut, by sex and year, with the number of samples in which there was length measures, the total number of individuals measured in these samples, the sampled catch and the range of lengths met, as the total catch of this species and the total hauls

made in the survey. In Fig. 4 and 5 we can follow the evolution along the years. We can follow a mode since 1997 until 2001, but since then no high new values appears. The highest recruitments were in 1997, 2001 and 2004. In 2005 the small individuals (around 22 cm) are the mode of the length distribution range.

### **Age numbers**

We present the abundance at age per stratified mean catch by haul in the Table 7 and Fig. 6, by sex and year. Individuals between 0 and 20 years were caught in the period 1997-2005, and in last years (most since 2002) younger individuals were caught. Perhaps it can be due to the change of gear and/or vessel. We can follow three conspicuous cohorts in our series, the 1994-1996 cohorts (ages 1, 2 and 3 in 1997). Cohorts from following years seem to be weaker than those ones, but more constant. And 2002-2003 cohorts appear to be quite strong, as we can see in recent years, especially 2003 one. This year the presence of all the ages-classes is very weak.

### **Mean length and mean weight**

Mean length and weight at age by sex over time are presented in Tables 8 and 9, and shown in Fig. 7 and 8. It seems that the greatest ages were increasing their mean length and weight until 2003, and falling in the youngest individuals, but this year the trend changes and these values decreased for ages 13 and 14+ and increased for ages 1 and 2.

### *American plaice*

#### **Introduction**

There was no directed fishing of American plaice in 1994 and there has been a moratorium from 1995. Even under moratorium, catches have increased substantially in recent years. Biomass and SSB are very low compared to historic levels. SSB declined to the lowest estimated level in 1994 and 1995. It has increased since then but still remains very low. There has been no good recruitment to the exploitable biomass since the mid-1980s (NAFO, 2005).

#### **Mean catches and Biomass**

American plaice haul mean catches by stratum are presented in Table 10, included swept area, number of hauls and SD. Stratified haul mean catches by stratum and year and their SD are presented in Table 11.

The entire time series (1997-2005) of biomass and their SD estimates of American plaice are presented in Table 12. Estimated parameters values of length-weight distribution  $a$  and  $b$  are presented in Table 13.

The American plaice indices show a general increasing trend along the years, agree with the results from the Canadian surveys. We can see a decreasing until the year 2002, and an increasing in 2003 and 2004, with a slight decreasing in 2005 (Fig. 9 and 10).

#### **Length Distribution**

The result of the model proposed by Warren for American plaice was the following:

$$\ln(\text{ratio}) = \exp(9.1237 + 0.1047l - 4.0231\ln(l))$$

Figure 11 shows the ratios and their fit. In this figure, we observed that, for the lengths below 12 cm, the data are very scattered, so, for these values, the mean of the ratios factor was applied, and two length-classes are formed as:

$$\text{For } l \leq 12 : \text{cf} = 12.0930$$

$$\text{For } l \geq 13 : \text{cf} = \exp(9.1237 + 0.1047l - 4.0231\ln(l))$$

Table 14 and Fig. 12 and 13 show the length distribution per haul stratified mean catches by sex and year, besides the sampled size and its catch, for the period 1997-2005. The data have been grouped two by two, so we present the data every two cm. In 2004 there is a great presence of juveniles (8 cm), and in 2005 the mode appears around 14 cm.

### **Age numbers**

We present the abundance at age per stratified mean catch by haul in the Table 15 and Fig. 14, by sex and year. The ALK is the Canadian one. We can follow a cohort without problems since the year 2000, starting in individuals of 2 years old (1998 cohort), reaching the 7 year old in 2005; a second cohort, weaker, can be followed since 1999, starting in 2 years old, too (1997 cohort). And more recently, a new cohort from the year 2002 (one year old in 2003), can be followed until this year.

### **Mean length and mean weight**

Mean length and weight at age by sex over time are presented in Tables 16 and 17, and shown in Fig. 15 and 16. The mean length is more or less stable in all ages, at least since the year 2002. The same occurs with the mean weight, although with more variations. The major variations appear in the older ages studied: 13, 14 and 15+ years old individuals. From 1997 to 1999 a general decreasing in the two means is observed.

### **Acknowledges**

The authors are very grateful to Karen Dwyer and Joanne Morgan from the DFO of Newfoundland & Labrador, in St. John's, for letting us to use the Canadian ALK for American plaice.

$$(**) SD = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$$

**TABLE 2 (cont.).** Swept area, number of hauls and Greenland halibut mean catch (kg) and SD (\*\*) by stratum. Spanish Spring Surveys on NAFO Div. 3NO: 1997-2005. Swept area in square miles. n.s. means stratum not surveyed. 1997-2000 data are transformed C/V *Playa de Mendoña* data, and 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

$$(**) SD = \frac{\sum (x_i - \bar{x})}{n-1}$$

**TABLE 2 (cont.).** Swept area, number of hauls and Greenland halibut mean catch (kg) and SD (\*\*) by stratum. Spanish Spring Surveys on NAFO Div. 3NO: 1997-2005. Swept area in square miles. n.s. means stratum not surveyed. 1997-2000 data are transformed C/V *Playa de Mendoña* data, and 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

$$(**) SD = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$$

**TABLE 3.** Stratified mean catches (Kg) by stratum and year and SD by year of Greenland halibut (1997-2005). n.s. means stratum not surveyed. 1997-2000 data are transformed C/V *Playa de Mendoña* data (by FPC). 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

**TABLE 4.** Survey estimates (by the swept area method) of Greenland halibut biomass (t) and SD by stratum and year on NAFO Div. 3NO. n.s. means stratum not surveyed. 1997–2000 data are transformed C/V *Playa de Mendoña* data. 2001–2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels. The last two rows present the biomass corresponding to set of ages 5+ and 10+.

**TABLE5.** Length weight relationships in the calculation of Greenland halibut biomass. The equation is  $Weight = a(l + 0.5)^b$   
 Spanish Spring Surveys on NAFO Div. 3NO: 1997-2005. To calculate the parameters for the indeterminate individuals, we used the total data  
 (males + females + indeterminate individuals)

**TABLE 6.** Greenland halibut length distribution per haul mean catches by sex and year. Number per stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005 Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Menduiña* data. 2002-2005 data are original R/V *Vizconde de Eza* data. In 2001, there are data from the two vessels. (\*) indicates untransformed data.

**TABLE 6 (cont.).** Greenland halibut length distribution per haul mean catches by sex and year. Number per stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005 Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Mendoña* data. 2002-2005 data are original R/V *Vizconde de Eza* data. In 2001, there are data from the two vessels. (\*) indicates untransformed data.

$$(**)SD = \frac{\sum(x_i - \bar{x})^2}{n-1}$$

**TABLE 10 (cont.).** Swept area, number of hauls and American plaice mean catch (kg) and SD (\*\*) by stratum. Spanish Spring Surveys on NAFO Div. 3NO: 1997-2005. Swept area in square miles. n.s. means stratum not surveyed. 1997-2000 data are transformed C/V *Playa de Mendumá* data, and 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

$$(**)SD = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$$

**TABLE 10 (cont.).**

Swept area, number of hauls and American plaice mean catch (kg) and SD (\*\*) by stratum. Spanish Spring Surveys on NAFO Div. 3NO: 1997-2005. Swept area in square miles. n.s. means stratum not surveyed. 1997-2000 data are transformed CV *Playa de Mendumá* data, and 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

**TABLE14.** American plaice length distribution. Estimated numbers per haul stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005. Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Mengíbar* data. 2002-2005 data are original R/V *Vizconde de Eza* data. In 2001, there are data from the two vessels. (\*) indicates untransformed data.

**TABLE 14 (cont.).** American plaice length distribution. Estimated numbers per haul stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005. Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Menduña* data. 2002-2005 data are original R/V *Vizconde de Ezza* data. In 2001, there are data from the two vessels. (\*) indicates untransformed data.

**TABLE 14 (cont.).** American plaice length distribution. Estimated numbers per haul stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005. Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Menduña* data. 2002-2005 data are original R/V *Vizconde de Ezza* data. In 2001, there are data from the two vessels. (\*) indicates untransformed data.

**TABLE 17 (Cont.).** American plaice mean weight (g) per haul mean catches by sex and year. Number per stratified mean catches. Spanish Spring Survey on NAFO 3NO: 1997-2005. Indet. means indeterminate. 1997-2000 data are transformed C/V *Playa de Menduíña* data. 2002-2005 data are original R/V *Vizconde de Eza* data. In 2001, there are data from the two vessels.

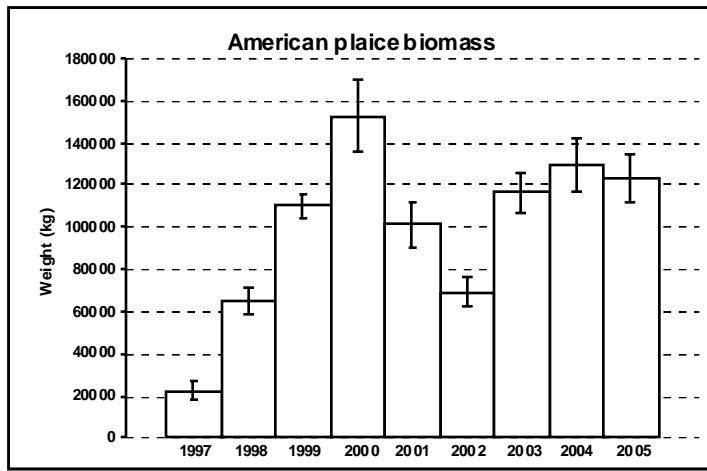

**Fig. 7.** Greenland halibut mean length (cm) at age on NAFO 3NO: 1997-2005. Ages from 0 to 14+.

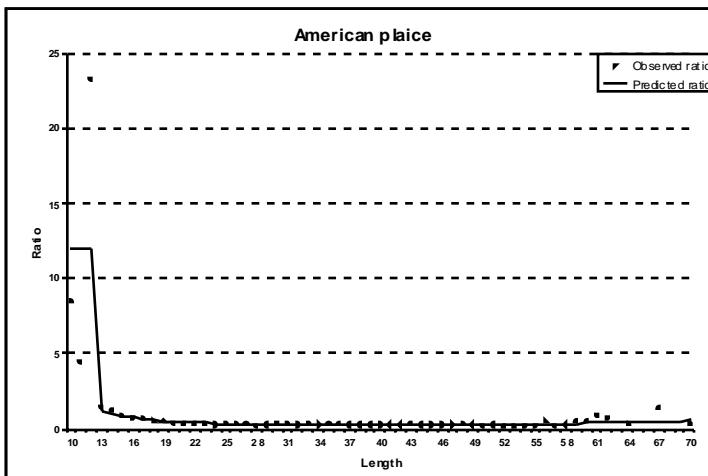

**Fig. 8.** Greenland halibut mean weight (gr) at age on NAFO 3NO: 1997-2005. Ages from 0 to 14+.

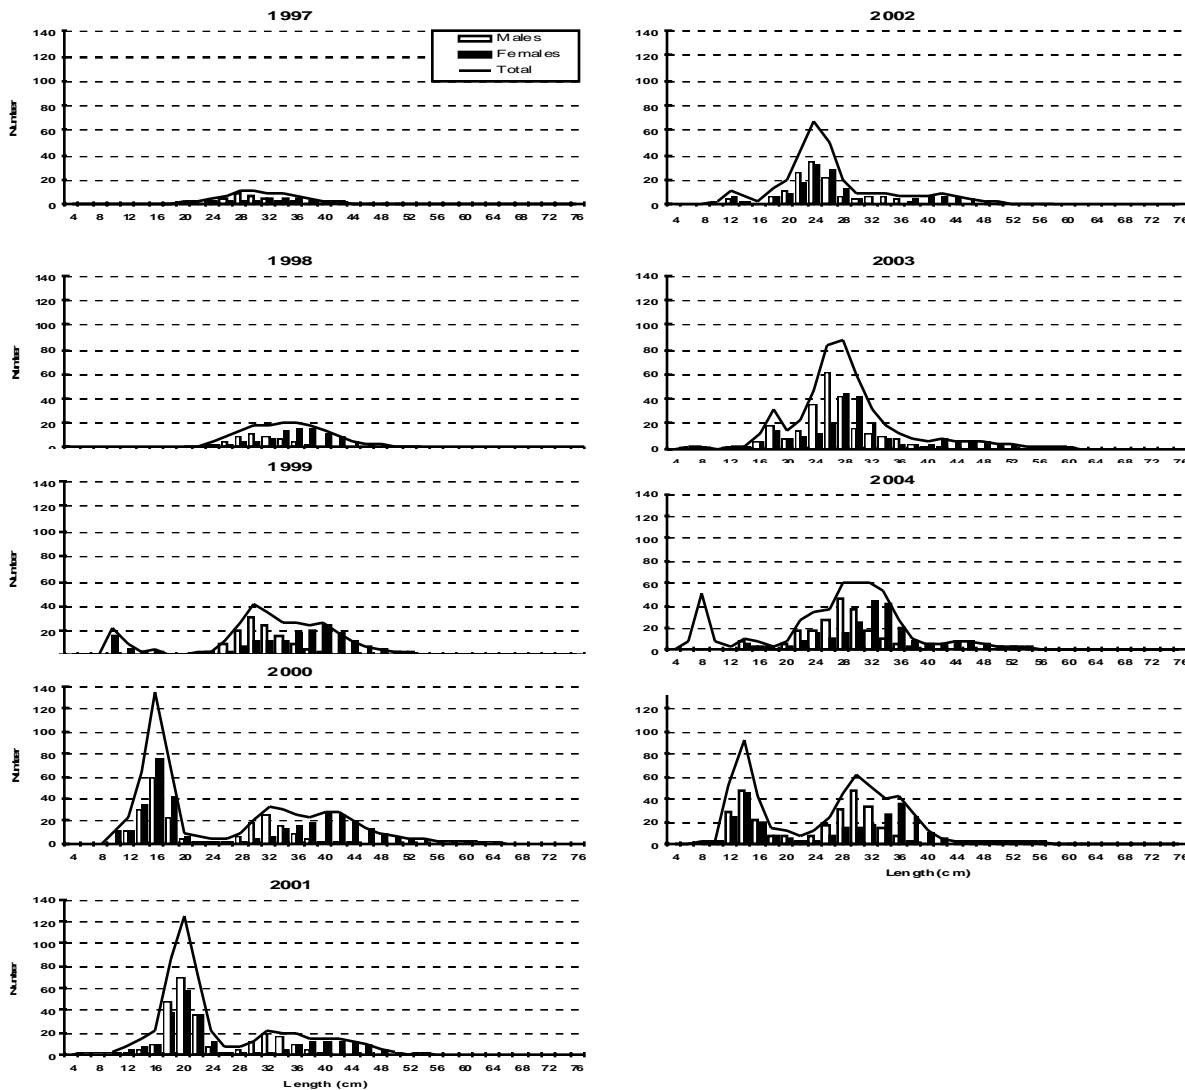

**Fig. 9.** American plaice stratified mean catches in Kg and  $\pm$ SD by year. Spanish Spring surveys on NAFO Div. 3NO: 1997-2005 (1997-2000 transformed data from C/V *Playa de Mendoña*; 2002-2005 original data from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels).

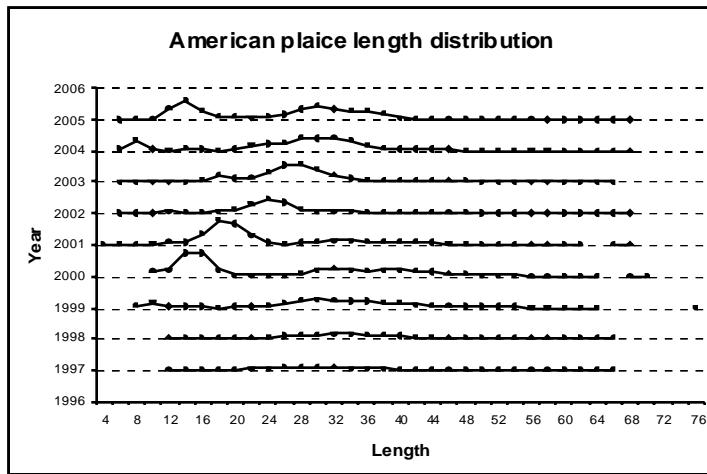

**Fig. 10.** American plaice biomass in tons and  $\pm$ SD by year. Spanish Spring surveys on NAFO Div. 3NO: 1997-2005 (1997-2000 transformed data from C/V *Playa de Menduña*; 2002-2005 original data from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels).

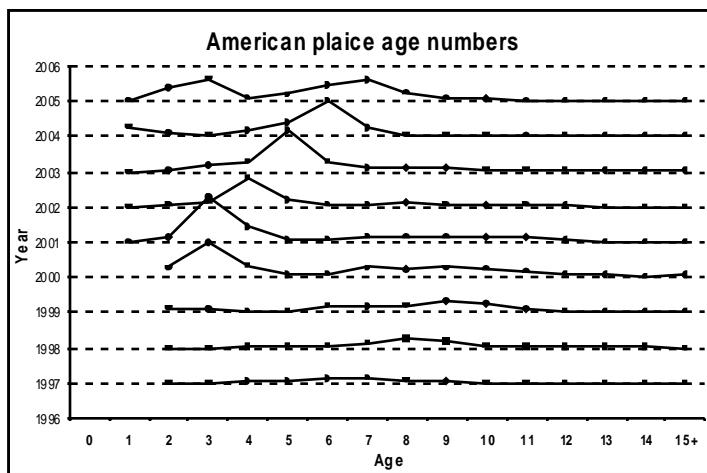

**Fig. 11.** Ratios of *Campelen* catch to *Pedreira* catch, by length group, of American plaice, from comparative fishing trials between the two gears on the C/V *Playa de Menduña* and the R/V *Vizconde de Eza*. The dots are the observed ratios and the curve is the fitted line.

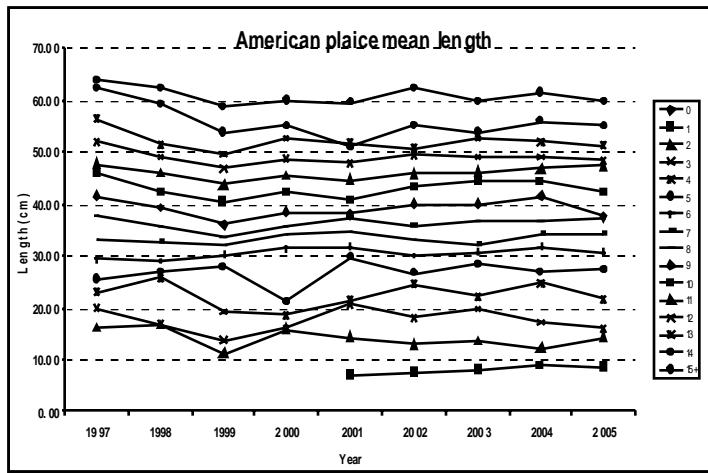

**Fig. 12** American plaice length distribution (cm) on NAFO 3NO: 1997-2005. Estimated numbers per haul stratified mean catches. 1997-2000 data are transformed data from C/V *Playa de Menduña*, and 2002-2005 data are original from R/V *Vizconde de Eza*. In 2001, there are data from the two vessels.

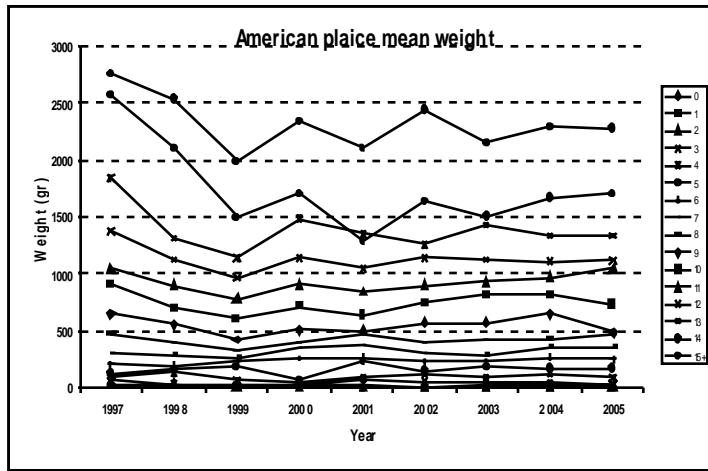

**Fig. 13.** Series of American plaice length distribution (cm) on NAFO 3NO: 1997-2005.

**Fig. 14.** Series of American plaice age distribution on NAFO 3NO: 1997-2005.

**Fig. 15.** American plaice mean length (cm) at age on NAFO 3NO: 1997-2005. Ages from 0 to 15+.

**Fig. 16.** American plaice mean weight (gr) at age on NAFO 3NO: 1997-2005. Ages from 0 to 15+.
