## SCIENTIFIC COUNCIL MEETING – SEPTEMBER 2007

Divisions 3LNO Northern shrimp (*Pandalus borealis*) – Interim Monitoring Update

By

D.C. Orr, P.J. Veitch and D.J. Sullivan

### Abstract

This document updates some of the indices for northern shrimp (*Pandalus borealis*) harvested within NAFO Divisions 3LNO. A full assessment for this resource was completed, within Scientific Council during autumn 2006, and management advice was provided for the years 2007 and 2008. The catch table (to September 2007) and biomass estimates (autumn 1995-spring 2007) are updated within this report. Preliminary data indicate that 24 015 t of shrimp were taken against an annual TAC of 22 000 t in 2006 while 16 865 t were taken in 2007 against an annual TAC of 22 000 t. It is anticipated that the 2007 TAC will be taken. The autumn 2006 3LNO biomass index was estimated to be 249 000 t (95% C.I. =  $\pm 49$  000 t), the second highest in the autumn time series, while the spring 2007 biomass index was 280 000 t (95% C.I. =  $\pm 88$  000 t), the highest on record.

### Fishery and Management

#### TAC regulation

Prior to 2004, TACs were set as 15% of the average lower confidence interval of the survey biomass indices for the most recent four consecutive surveys. However, during 2004, Scientific Council (SC) felt it was necessary to base advice upon a new methodology due to the highly variable nature of the spring surveys. The TAC within an adjacent Canadian stock had been 12% of the fishable biomass since 1997. Applying this percentage to the inverse variance weighted average fishable biomass from the autumn 2002-spring 2004 surveys resulted in a TAC of 22 000 t. Had this new method been used in 2003, it is likely that the advised TAC for 2005 would have been around 22 000 t instead of the 13 000 t actually advised. Scientific Council noted that the TAC recommendation for this stock has always included advice that "the development of any fishery in the Div. 3L area take place in a gradual manner with conservative catch limits imposed and maintained for a number of years in order to monitor stock response." The initial TAC of 6 000 t was in place for 3 years (1999-2001), however the TAC of 13 000 t had been in place since the beginning of 2003. A two year period was insufficient to determine the impact of a 13 000 ton catch level upon the stock; therefore SC recommended that the 13 000 TAC be maintained through 2005. Scientific Council recommended that the TAC for shrimp in Div. 3LNO in 2006 should not exceed 22 000 t. At that time, SC reiterated its recommendation that the fishery be restricted to Div. 3L and that the use of a sorting grate with a maximum bar spacing of 22 mm be mandatory for all vessels in the fishery. During the November 2006 shrimp assessment, SC decided that this advice should extend through 2008, and that the advice would be reviewed in September 2007 (NAFO, 2006).

### Catch trends

Catches increased dramatically since 1999, with the beginning of a regulated fishery. There are a number of sources that question the annual catches of shrimp in the NRA and in 3M. An attempt will be made to resolve the catch issue during the October – November 2007 shrimp assessment. Table 1 and the following discussion provide the available numbers to date. Over the period 2000-2006, catches increased from 4 869 to 24 015 t. As of September 2007, total catches in 3L were 16 865 t and it is anticipated that the quota will be taken. As per NAFO agreements, Canadian vessels took most of the catch during each year. Canadian catches increased from 4 250 t in 2000 to 18 271 t in 2006. By September 2007, Canadian vessels took 14 284 t of shrimp and it is anticipated that the 18 570 t Canadian quota (18 325 t quota plus transfers) will be taken. Catches by other contracting parties increased from 619 t in 2000 to 5 744 t in 2006. By September 2007, they had taken 2 581 t of shrimp and it is anticipated that their 3 430 t quota will be taken. Table 1 provides a breakdown of catches by contracting party and year since 1999, while figure 1 indicates catches and TAC since 1993.

### Canadian Multi-species Bottom Trawl Research Survey Trends

Spring and autumn multi-species research surveys have been conducted onboard the Canadian Coast Guard vessels *Wilfred Templeman*, *Teleost* and *Alfred Needler* since 1995. Fishing sets of 15 minute duration, with a tow speed of 3 knots, were randomly allocated to strata covering the Grand Banks and slope waters to a depth of 1 462 m in the autumn and 731 m in the spring, with the number of sets in a stratum proportional to its size (Figure 2). All vessels used a Campelen 1800 shrimp trawl with a codend mesh size of 40 mm and a 12.7 mm liner. SCANMAR sensors were employed to monitor net geometry. Details of the survey design and fishing protocols are outlined in (Brodie, 1996; McCallum and Walsh, 1996).

Prior to autumn 2003, shrimp were frozen and returned to the Northwest Atlantic Fisheries Centre where species identifications were made, and number and weight per set were calculated. Beginning with the autumn 2003 survey, most of the shrimp samples have been processed at sea. Samples that could not be processed at sea were frozen and processed in the Northwest Atlantic Fisheries Centre upon return. Stratified abundance and biomass indices were estimated *via* areal expansion using programs based upon Cochran (1997) and written in SAS (D.C. Orr, unpublished).

The autumn 2006 biomass estimate for NAFO Divisions 3LNO was 248 790 t (95% C.I. =± 48 785 t), the second highest biomass index in the autumn time series (Table 2; Figure 3). The spring 2007 biomass estimate for NAFO Divisions 3LNO was 280 372 t (95% C.I. =± 88 271 t), the highest biomass index in the survey time series (Table 3; Figure 4).

It must be noted that deepwater strata (deeper than 731 m) within Divisions 3LNO as well as several shallow water strata within Division 3L were not surveyed during autumn 2004 (Brodie, 2005; Healey and Dwyer, 2006). Historically very few northern shrimp have been taken from the deepwater strata; therefore, the impact of not sampling the deepwater was felt to be negligible. Strata that were missed, in Division 3L, (autumn 2004) are highlighted in table 4 and figure 5. All NAFO Regulatory Area (NRA) strata containing significant quantities of northern shrimp, throughout the survey time series, were surveyed during autumn 2004 (Table 4; Figures 5 - 7).

Analyses of the autumn survey data indicate that the shallow (93-549 m) 3L strata missed in 2004 are important in determining the biomass indices. Typically these strata account for 25-61% of the 3L biomass (Table 4). Figure 6 confirms the importance of these strata and that catches, within these strata, vary annually. Therefore, it was not appropriate to use a multiplicative model to estimate 3L biomass and abundance indices from the autumn 2004 survey. However, analyses conducted on strata that had been consistently fished each autumn since 1995 resulted in biomass estimates of 96 926 t (95% C.I. = ±21 744 t) to 125 300 t (95% C.I. = ±52 693 t) over the period 2004 – 2006; three out of the four highest values within this partial index time series (Table 5). It should be noted that the confidence intervals of the biomass estimates from strata completed in this portion of the autumn surveys are relatively tight, indicating relatively low variances in catches. Further, the lower confidence limits of the partial autumn 2004 - 2006 surveys are above the lower confidence limits from the previous estimates in the partial survey time series. The inclusion of additional strata in the overall biomass index would result in the index increasing or staying the same. Therefore one may conclude that the partial biomass index from the autumn of 2004 was at least as high as it was in the past five years and that the biomass within these strata has increased since 1999.

All strata within 3LNO (<731 m) were surveyed during autumn 2006 (Figure 6). Tables 4 and 6 -8 provide the strata by strata break down of biomass by year and NAFO Division while table 8 provides percentages of the resource available to the NRA. Over 90% of the biomass may be attributed to NAFO Division 3L; 11 – 24% of the 3L biomass is found within the NRA. Between 0.2% and 9% of the 3LNO biomass is found within 3N while less than 1% of the total biomass is found within 3O (Table 8).

The spring 2007 3L biomass estimate was 280 091 t (95% C.I. = ± 88 271 t) (Table 9; Figure 4). Throughout the history of the spring survey, it was possible to survey all NAFO Division 3L strata that are important for shrimp (100 m - 751 m). However, due to operational difficulties it was not possible to survey all of the strata within NAFO Divisions 3NO during spring 2006. Strata 373 and 383 as well as most strata deeper than 92 m were not surveyed (Figure 7). Analyses from the spring 1999 - 2007 surveys indicated that greater than 96% and 50% of the 3N and 3O biomass respectively may be attributed to the strata that were missed (Tables 10 and 11). Therefore biomass and abundance indices were not determined for NAFO Divisions 3NO during spring 2006. Historically, at least 97% of the 3LNO biomass is found within Division 3L (Table 12). The spring 2006 3L biomass index was 185 156 tons (95% C.I. = ± 115,048 tons), the third highest in the spring time series.

Tables 9 - 12 provide the strata by strata break down of biomass by year and NAFO Division while table 12 provides percentages of the resource available to the NRA. Over 97% of the spring biomass may be attributed to NAFO Division 3L; 12 – 30% of this biomass is found within the NRA. Between 0.05% and 3% of the 3LNO biomass is found within 3N while less than 0.2% of the total biomass is found within 3O (Table 12).

### **Conclusions**

Preliminary data indicate that 16 865 t of shrimp had been taken in the 3L shrimp fishery by September 2007 and it is anticipated that the entire 22 000 t quota will be taken by the end of December 2007.

The autumn 2006 NAFO Divisions 3LNO biomass index was 248 790 t, the third highest in the survey time series. The spring 2007 Divisions 3LNO biomass index was 280 372 t, the highest in the survey time series; however the spring biomass indices are thought to be less precise. Based on the information available, no change is proposed for the Scientific Council advice for a TAC of 22 000 t in 2008.

### **Acknowledgements**

We would like to thank Mr. Gus Cossitt for producing Fig. 3, which indicates the 3L strata missed during the Canadian autumn 2004 research survey.

Table 9. Biomass estimates (t) of northern shrimp (*Pandalus borealis*) Canadian spring multi-species bottom trawl surveys in Div. 3L using a Campelen 1800 shrimp trawl during 1999 - 2007. The inshore strata were not consistently sampled over the years therefore this table includes only offshore strata. (standard 15 min. tows).

Forest area and biomass estimates by strata (standard 10 mm rule).

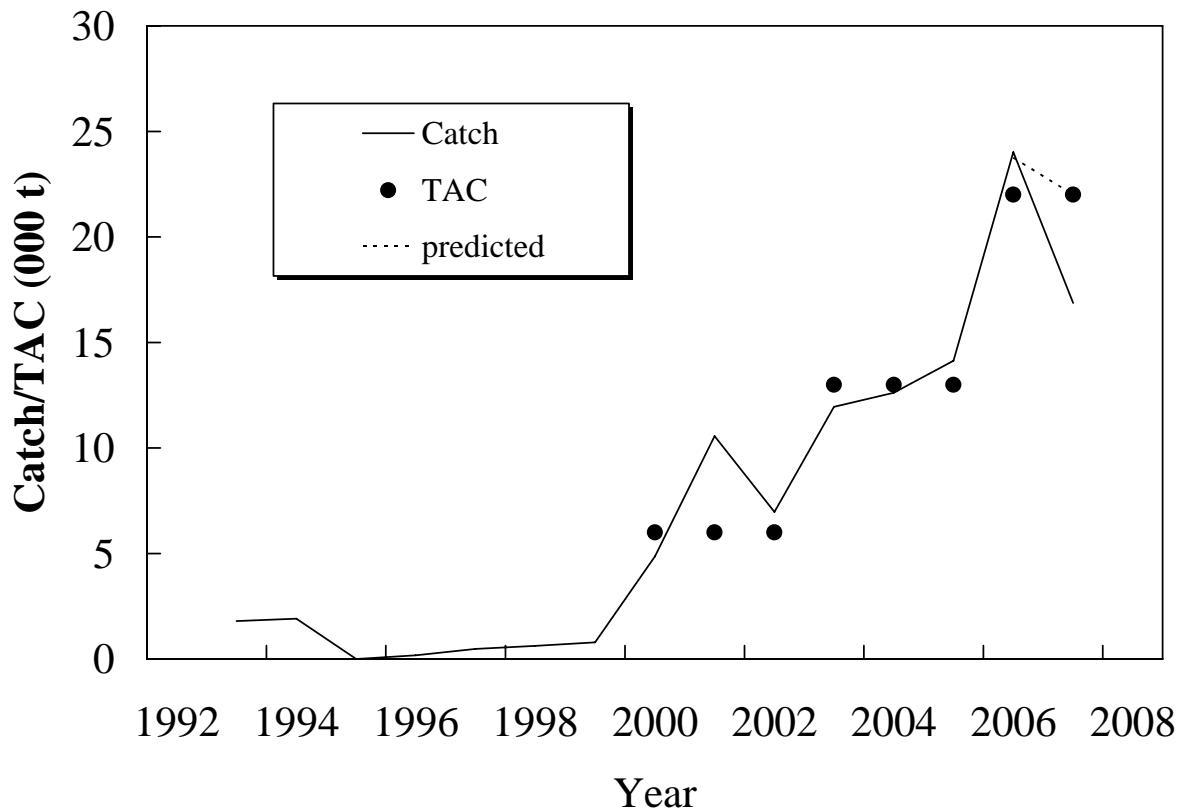

Figure 1. Trends in NAFO Div. 3LNO northern shrimp (*Pandalus borealis*) catch (t) and TAC over the period 1993-2007.

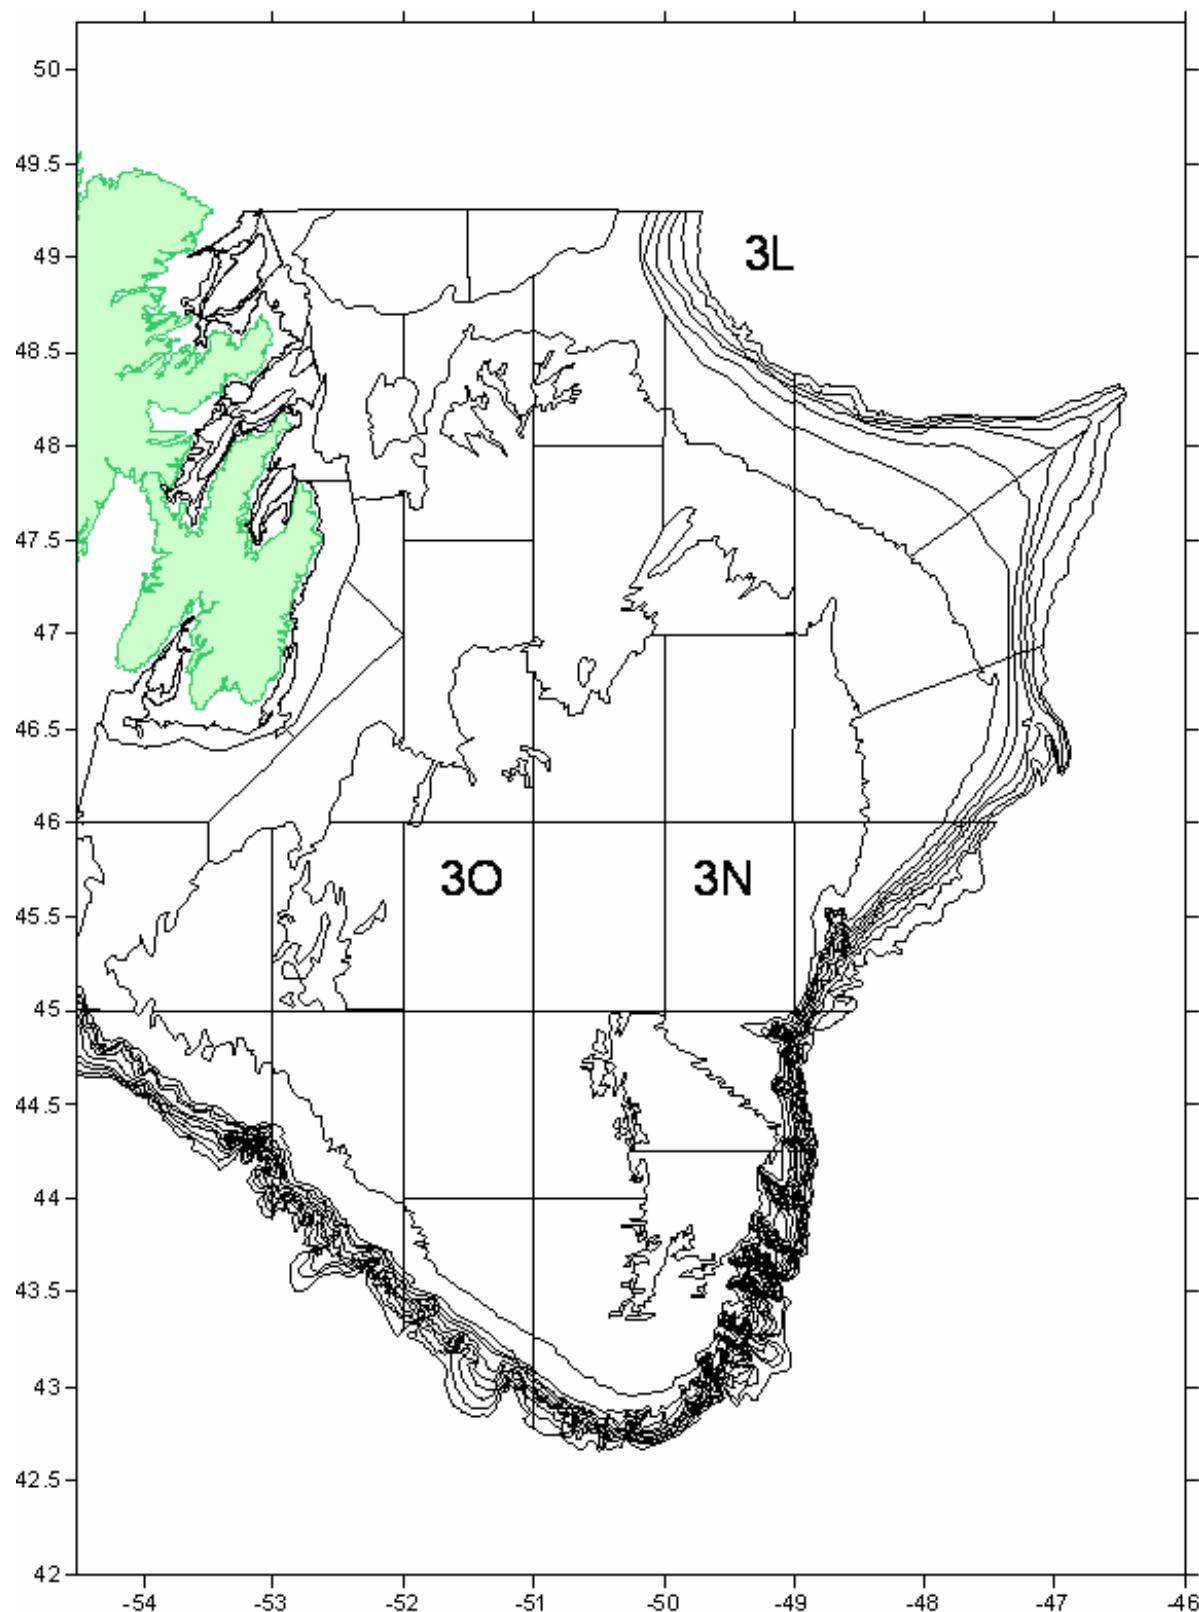

Figure 2. The NAFO 3LNO stratification scheme used in Canadian research bottom trawl survey set allocation.

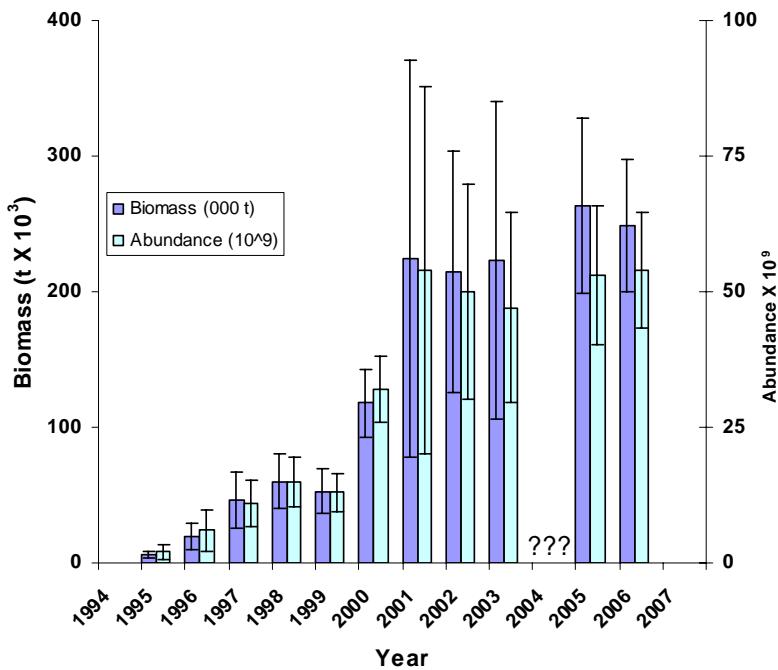

Figure 3. Autumn northern shrimp (*Pandalus borealis*) abundance and biomass estimates within NAFO Div. 3LNO. Data were from Canadian multi-species bottom trawl surveys using a Campelen 1800 trawl. (Standard 15 min. tows.)

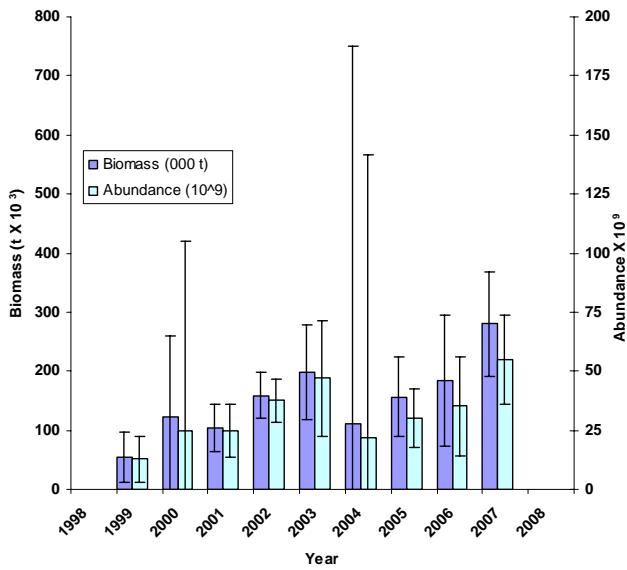

Figure 4 Spring northern shrimp (*Pandalus borealis*) abundance and biomass estimates within NAFO Div. 3LNO. Please note that due to operational problems, it was not possible to survey all of Div. 3NO during spring 2006. The indices for 2006 are for Div. 3L only. Data were from Canadian multi-species bottom trawl surveys using a Campelen 1800 trawl. (Standard 15 min. tows.)

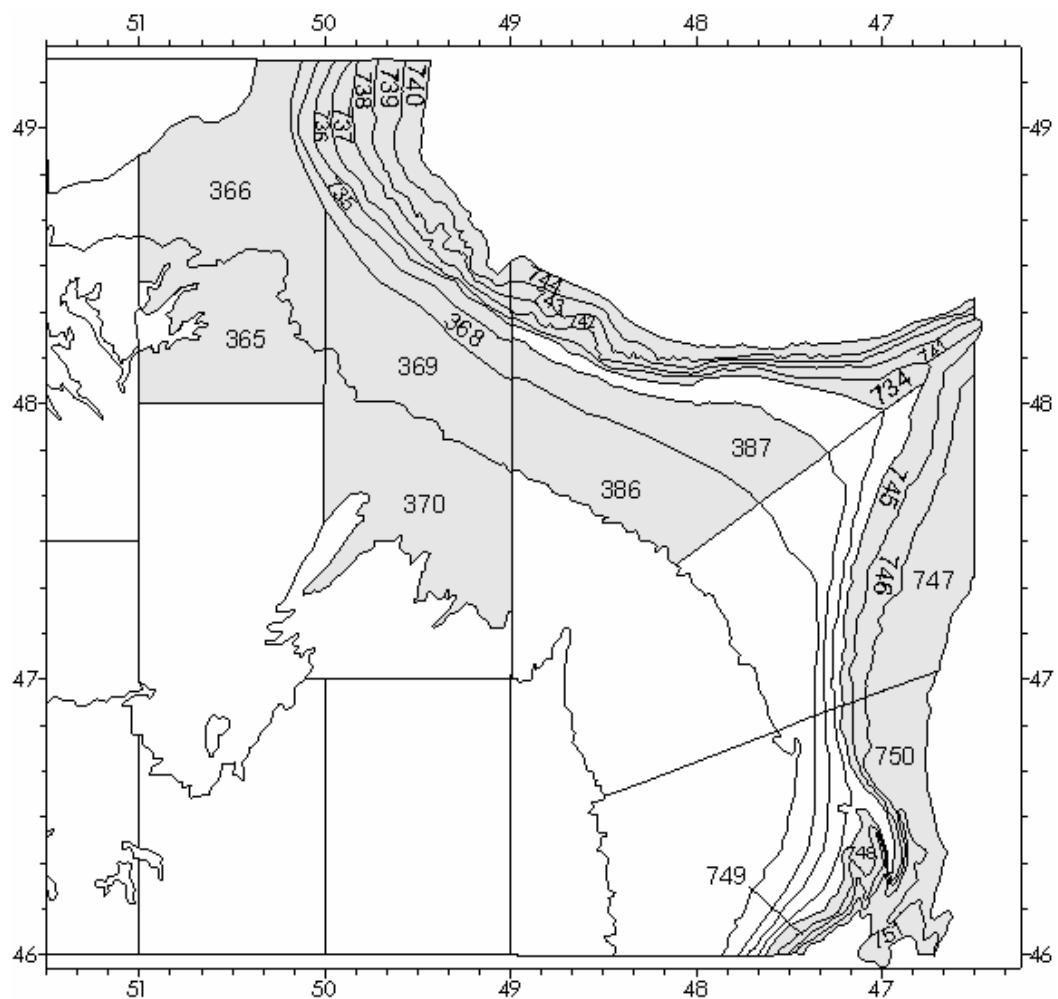

Figure 5. Strata in Div. 3L that were not surveyed (numbered and shaded area) during autumn of 2004.

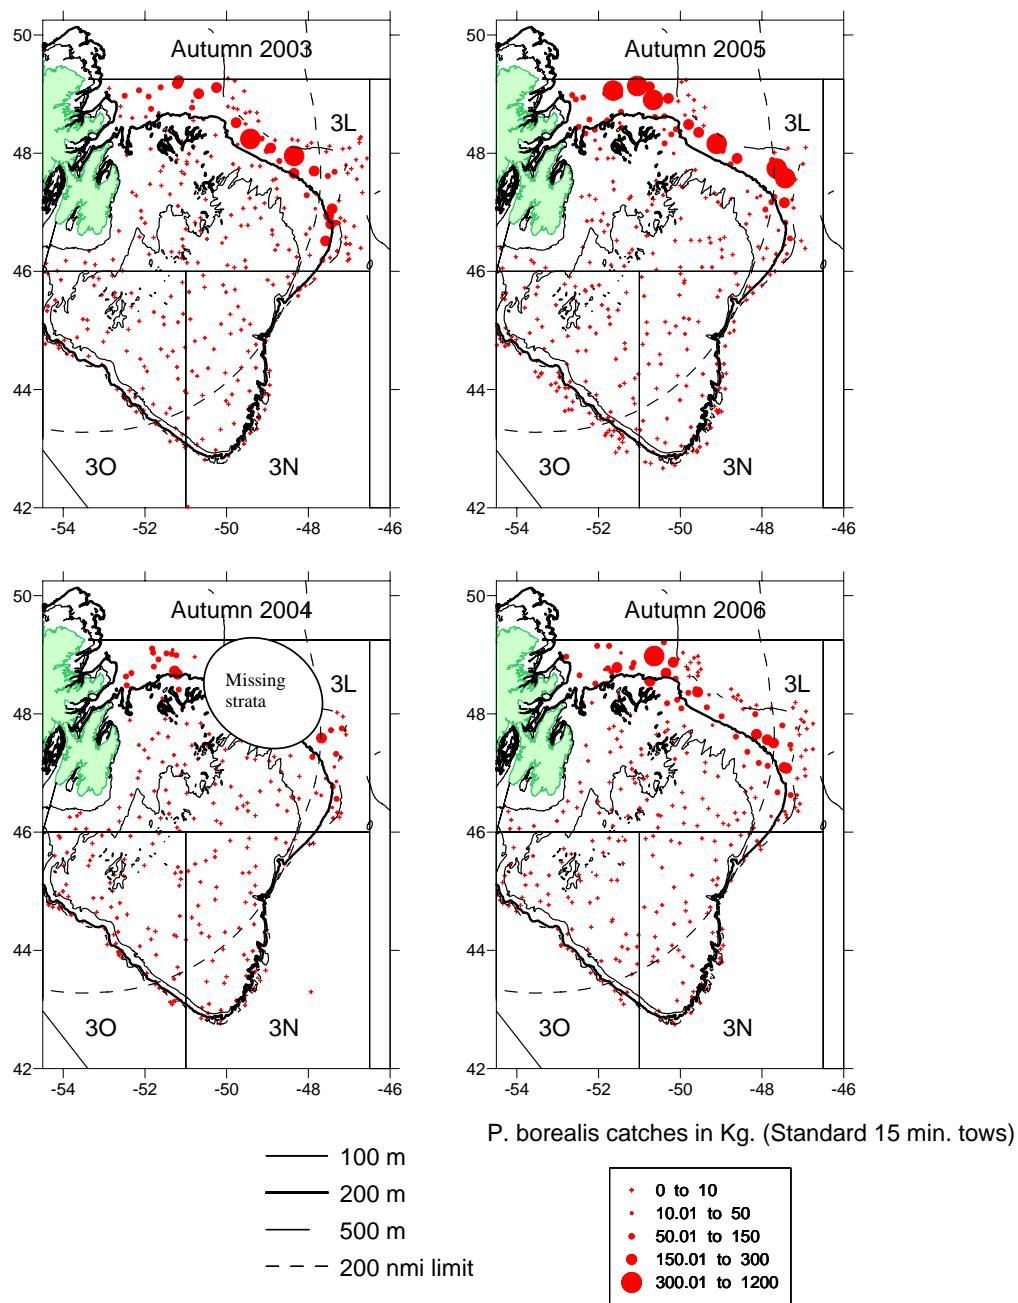

Figure 6. Distribution of NAFO Div. 3LNO northern shrimp (*Pandalus borealis*) catches kg/tow as obtained from autumn research bottom trawl surveys conducted over the period 2003-2006.

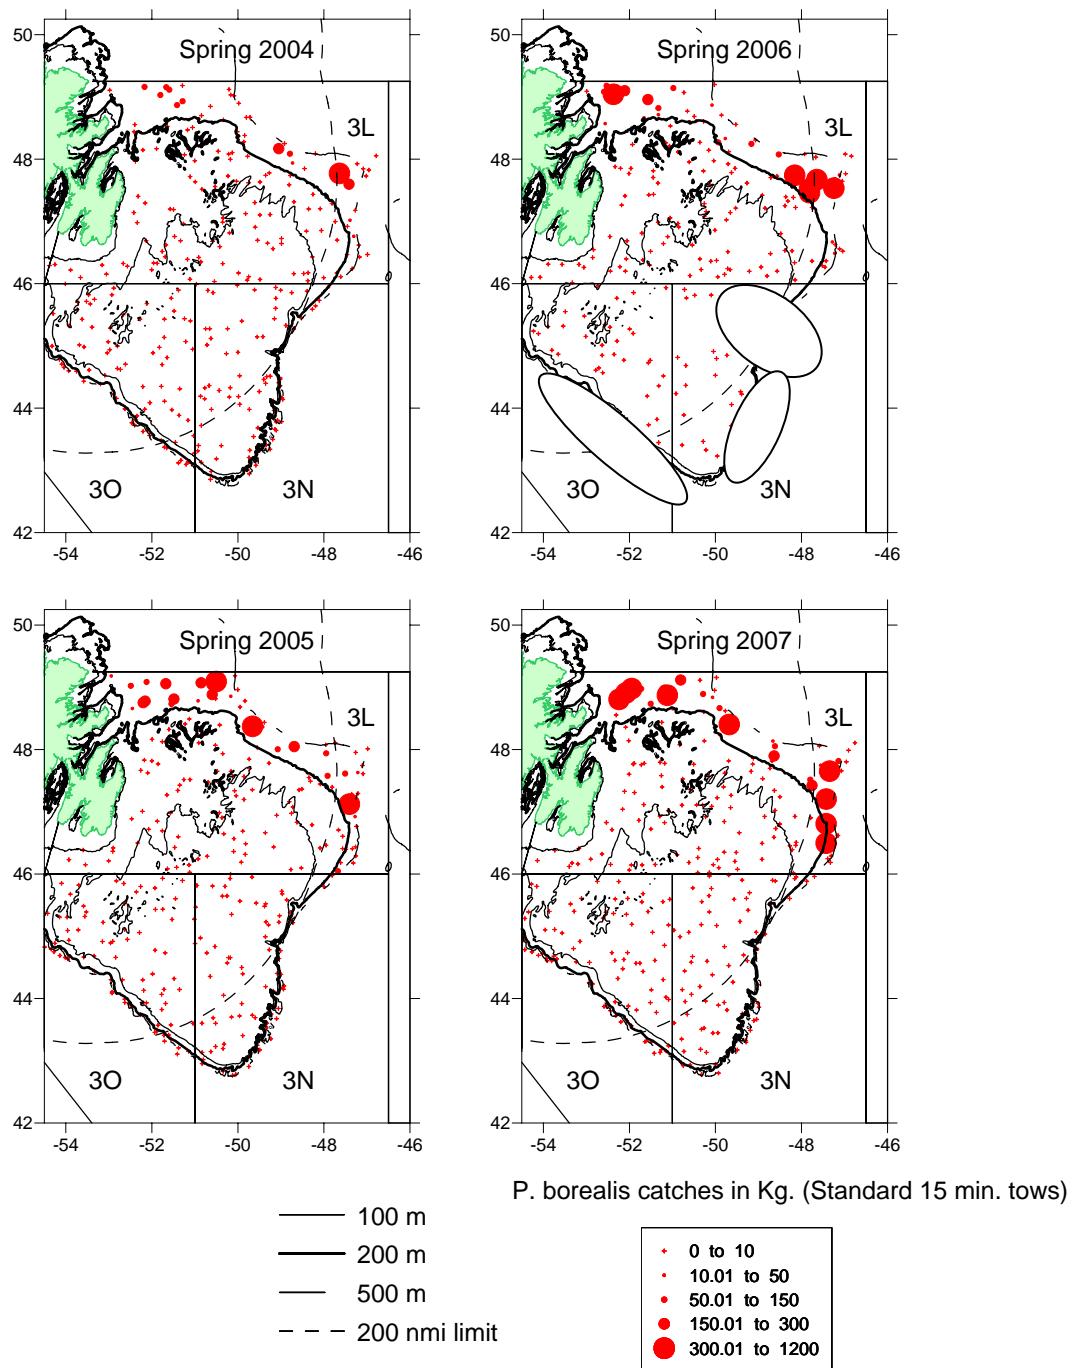

Figure 7. Distribution of NAFO Div. 3LNO northern shrimp (*Pandalus borealis*) catches kg/tow) as obtained from spring research bottom trawl surveys conducted over the period 2004-2007. Ellipses indicate strata not surveyed during spring 2006.
