INIAP/IPIMAR
Av. BRASÍLIA 1449-006, LISBOA, PORTUGAL

A. Status of the fisheries

In 2006, the Portuguese nominal catches proceeding from NAFO Regulatory Sub Area 3 have reached a similar value (12 341 ton) that recorded since 2004. Over recent years nominal catches increased continuously from 2000 to 2003, when they peak at 21 300 ton, but declined sharply afterwards, to 12 800 ton and 11 500 ton in 2004-2005 (Table I).

In 2006, the fishing effort in days was the same as 2005 but the fishing effort in hours increased 25%. In Div. 3N fishing effort fell again by half, both in fishing days and fishing hours. In Div. 3L the effort declined almost 20% in fishing days, but remains stable in fishing hours. In Div. 3M and Div. 3O the effort increased, both in fishing days (12% and 44%, respectively) and in fishing hours (29% and 86%, respectively).

The increase in total catch (Table I-A) was mainly due to increase in redfish (+6%), which reached the highest value since 1993 (9 828 ton). Other important increase was observed in the by-catch of cod (+69%) and in the catch of skates (+74%). Major drops are observed on roughhead grenadier (-47%) and white hake (-38%). By-catches of American plaice (361 ton), yellowtail (194 ton) and witch flounder (137 ton) were kept in 2006 within their recent levels.

Redfish continues to be by far the most important species in the Portuguese commercial catches from Sub Area 3, representing on recent years 50% or more of the overall catch. Div. 3O continues to be the most important ground for this fishery and have increase from 2005 to 2006 (+14%). The catch of redfish in Div. 3M remains stable, but their relative weight in the total catch of this division decreased (-7%), due to the increase of Greenland halibut catch.

The Greenland halibut catches decreased in Div. 3N (-84%) and 3O (-79%). However catches doubled in Div. 3M and increased 13% in Div. 3L, the division where Greenland halibut and roughhead grenadier continued to represent the bulk of the catches (above 90% in 2005-2006). In Div. 3N the relative weight of these two species has been declining from 76% in 1998 to 35% in 2004-2005 and 11% in 2006. In this division, the skates continue to be the most important fishery, now with 70% of total catch (37% in 2005).

B. Portuguese Annual Sampling Program**1. Catch and effort sampling.**

Effort and CPUE data for 2006 Portuguese trawl fishery on the NAFO Regulatory Area were obtained through the revision of skipper logbooks from two trawlers, kindly supplied by its owners. All the information (round weight of the catch by species, fishing effort, positions and depths) has been recorded on a tow-by-tow basis. The vessel conversion factors were used to convert its processed landings in catches. Effort data obtained through the revision

of the 2006 logbooks available were processed in order to convert the 2006 Portuguese effort, reported in fishing days, on the 2006 Portuguese STATLANT 21-B, into fishing hours (Table II-A/B).

The daily catch and effort data from the logbooks were used to estimate the directed effort and CPUE for each of the target species/stock, as well as the main by-catch species and depth range of the different fisheries, on a monthly basis. The majority of the fishing effort was directed towards Greenland halibut and redfish.

Following the September 1996 recommendation of the NAFO Scientific Council as regards the availability of witch flounder fishery data, a column with the by-catch of this species on the Greenland halibut fishery is included in Table III. Data regarding directed effort and catch rates are presented in Table III to IV-B and Fig. 1.

The Greenland halibut cpue series was updated with the 2006 observed CPUEs, this update only included one vessel in 2006 because if we include the other vessel (new vessel with new gear) the analysis give unrealistic values. The additive model (Ávila de Melo and Alpoim, 1995), was upgraded in 1998 (Alpoim *et al.*, 1998), and used like in previous years to standardise the observed CPUEs. From January 1988 till April 1995 each monthly observed CPUE of this series was previously corrected for 130mm mesh size (Ávila de Melo and Alpoim, 1996). In this analysis, any observation corresponding to a month and a trawler with less than 10 hours of directed effort was rejected. The CPUEs are presented in Tables IV and Fig. 1, with the associated standard errors (+/- 2 standard errors in the Figures) and coefficients of variation.

1.1. Comments on catch and effort data (based on the vessels sampled)

1.1.1. Greenland halibut in Div. 3L, 3M, 3N and 3O

In Div. 3L catch rates declined prior to the boom of the deep-water fishery (Table IV-A, Fig. 1). However, it is from 1990 to 1991, i.e. from the first to the second year of this new fishery in the Regulatory Area, that CPUEs fell by half. Between 1991 and 1994 catch rates remained stable at a low level. Since then catch rates gradually increased, reaching an upper level in 1999-2000. Catch rate declined in 2001 and remained stable at that lower level in 2002 and 2003. In 2004 the catch rate decline again, reaching the lowest value since 1994. However in 2005 and 2006 the Greenland halibut catch rate in Div. 3L recovered and is in 2006 at the 1999-2000 levels.

For all Div.3LMNO combined (Table IV-A, Fig. 1) the observed catch rates series follows the Div. 3L pattern, since this is the division of Sub Area 3 with the highest concentration of Greenland halibut fishing effort.

2. Biological Sampling

In 2006 biological sampling was obtained from two stern trawlers fishing in Div. 3L, 3M, 3N and 3O during all the year. Apart from species under moratoria, a priority to be sampled whenever they appear in the hauls, biological sampling was conducted for the two most abundant species in each haul, following the NAFO sampling recommendations.

Greenland halibut, redfish (*S. mentella*), American plaice, witch flounder, thorny skate and spinytail skate were sampled in Div. 3L, 3M, 3N and 3O (Table V). Cod were sampled in Div. 3M, 3N and 3O. Roughhead grenadier were sampled in Div. 3L and 3M. Yellowtail flounder, white hake and monkfish were sampled in Div. 3N and 3O. Redfish (*S. marinus*) were sampled only in Div. 3M.

Since 1996, all commercial information is representative of the catch as a whole, although sampling continues to be carried out by sex with the exception of cod, white hake, Atlantic halibut, skates and monkfish. Mean length and weight at age are the mean of mean lengths and weights at age by sex, weighted by the abundance in the sampled catches of males and females at each age. For all species mean weight at age and mean weight in the catch are derived from the length-weight relationships calculated from the commercial sampling in 2006 (Table VI). For some stocks such as 3NO Cod, 3LN Redfish, 3LNO American plaice, 3LNO Yellowtail flounder and White hake the length-weight relationships used were those from the 2004 commercial sampling (Vargas, 2005), due to the small length/weight sampling in 2006.

2.1. Length composition of the 2006 skate net trawl fishery (280mm codend mesh size).

Some sets in Div. 3N and 3O were made with a skate trawl net with 280mm mesh size in the codend, representing 3,5% in Div.3N and 4,5% in Div 3O of the total effort sampled. In these sets the main species were sampled. Length frequency, mean length and mean weight in the catch are presented for cod (Tab. VIII-B, IX-B; Fig. 3B, 4B), redfish (*S. mentella* – Tab XIII-B, Fig. 8B), American plaice (Tab. XVII-B, XVIII-B; Fig. 12B, 13B), yellowtail flounder (Tab. XIX-B, Fig. 14B), witch flounder (Tab. XXIX-B, XXX-B; Fig. 24B, 25B), white hake (Table XXXII-B, Fig. 26B), thorny skate (Tab. XXXV-B, XXXVI-B, Fig. 29B, 30B) and monkfish (Tab. XLI-B, XLII-B; Fig. 33B). The size of these catches within the overall sampled catch in Div. 3N is about 15% for cod, 82% for American plaice, 87% for yellowtail flounder, 9% for witch flounder, 87% for thorny skate and 54% for monkfish. In Div. 3O is about 7% for cod, 1% for redfish (*S. mentella*), 46% for American plaice, 11% for witch flounder, 9% for white hake, 60% for thorny skate and 29% for monkfish.

2.2. Length composition of the 2006 trawl fishery (130mm codend mesh size).

2.2.1. Cod Div. 3M

Information on length composition of the cod by-catch in Div. 3M is available for April, July, August and October (Table VII, Fig. 2), from 170m to 840m depth.

Lengths between 48cm and 63cm dominated the catch, with a modal classes at 57cm and 60cm (mean length and weight of 58cm and 2362g).

2.2.2. Cod Div. 3N

Information on length composition of the cod by-catch in Div. 3N is available for July and from October to December (Table VIII-A, Fig. 3A), from 62m to 534m depth.

Lengths between 42cm and 54cm dominated the catch, with a clear modal class at 51cm (mean length and weight of 49cm and 1433g). In 2000-2006 years, mean length are no trends but declined sharply since 2004 (Fig. 5).

2.2.3. Cod Div. 3O

Information on length composition of the cod by-catch in Div. 3O is available for April, June, July and from October to December (Table IX-A, Fig. 4A), from 121m to 620m depth.

Lengths between 39cm and 51cm dominated the catch, with a clear modal class at 42cm (mean length and weight of 46cm and 1153g). In 2000-2006 years, mean length are no trends but declined sharply since 2004 (Fig. 5), like in Div.- 3N.

2.2.4. Redfish (*S. mentella*) Div. 3L

Information on length composition of the redfish (*S. mentella*) trawl by-catch in Div. 3L is available from February to April and for August (Table X, Fig. 5), from 693m to 1410m depth.

Lengths between 27cm and 30cm dominated the catch, with a modal class at 30cm (mean length and weight of 29cm and 351g). In 2000-2006 years, mean length remains stable in this Div. (Fig. 10)

2.2.5. Redfish (*S. mentella*) Div. 3M

Information on length composition of the redfish (*S. mentella*) trawl catch in Div. 3M is available for February and April and from July to October (Table XI, Fig. 6), from 208m to 1148m depth.

Lengths between 21cm and 24cm dominated the catch, with a modal class at 22cm (mean length and weight of 24cm and 207g). Stable between 2000 and 2003 years, mean length presents great oscillations since 2004 (Fig. 10).

2.2.6. Redfish (*S. mentella*) Div. 3N

Information on length composition of the redfish (*S. mentella*) trawl by-catch in Div. 3N is available for July and from October to December (Table XII, Fig. 7), from 136m to 748m depth.

Lengths between 21cm and 23cm dominated the catch, with a modal classes at 22cm and 23cm (mean length and weight of 24cm and 204g). In this Div., the mean length presents a continuous decrease since 2000 (except for 2004), reached in 2006 the same value of the mean length in Div. 3M (Fig. 10)

2.2.7. Redfish (*S. mentella*) Div. 3O

Information on length composition of the redfish (*S. mentella*) trawl catch in Div. 3O is available for April, June and July and from October to December (Table XIII-A, Fig. 8A), from 121m to 750m depth.

Lengths between 20cm and 24cm dominated the catch, with a modal class at 22cm (mean length and weight of 23 cm and 191g). In 2000-2006 years, mean length remains stable in this Div. (Fig. 10)

2.2.8. Redfish (*S. marinus*) Div. 3M

Information on length composition of the redfish (*S. marinus*) trawl by-catch in Div. 3M is available for April and from July to October (Table XIV, Fig. 9), from 170m to 406m depth.

Lengths between 25cm and 31cm dominated the catch, with a clear modal classes at 27 and 28cm (mean length and weight of 28 cm and 305g).

2.2.9. American plaice Div. 3L

Information on length composition of the American plaice by-catch in Div. 3L is available from January to April (Table XV, Fig. 10), from 645m to 1514m depth.

Lengths between 30cm and 40cm dominated the catch, with a modal classes at 30cm, 32cm and 36cm (mean length and weight of 37cm and 549g).

2.2.10. American plaice Div. 3M

Information on length composition of the American plaice by-catch in Div. 3M is available only for January (Table XVI, Fig. 11), from 840m to 1151m.

Despite the very small sampling, we can conclude that lengths between 34cm and 42cm dominated the catch, with a clear modal class at 40cm (mean length and weight of 40cm and 660g).

2.2.11. American plaice Div. 3N

Information on length composition of the American plaice by-catch in Div. 3N is available for July, October and November (Table XVII-A, Fig. 12A), from 62m to 309m depth.

Lengths between 26cm and 30cm (and at 34cm) dominated the catch, with a modal classes at 26cm, 28cm and 30cm (mean length and weight of 33cm and 425g).

2.2.12. American plaice Div. 3O

Information on length composition of the American plaice by-catch in Div. 3O is available for April, June and July and from October to December (Table XVIII-A, Fig. 13A), from 93m to 637m depth.

Lengths between 30cm and 40cm dominated the catch, with a modal class at 36cm (mean length and weight of 38cm and 661g).

2.2.13. Yellowtail flounder Div. 3N

Information on length composition of the yellowtail flounder catches in Div. 3N is available only for July and November (Table XIX-A, Fig. 14A), from 62m to 98m depth.

Lengths at 34cm, 36cm, 40cm and 42cm dominated the catch, with a very clear modal class at 40cm (mean length and weight of 39cm and 583g).

2.2.14. Yellowtail flounder Div. 3O

Information on length composition of the yellowtail flounder catches in Div. 3O is available only for July and November (Table XX, Fig. 15), from 93m to 430m depth.

Lengths between 30cm and 38cm dominated the catch, with a very clear modal classes at 34cm and 36cm (mean length and weight of 35cm and 427g).

2.2.15. Greenland halibut Div. 3L

Information on length composition of the Greenland halibut catches in Div. 3L is available from January to April and from August to October (Table XXI, Fig. 16), from 645m to 1557m depth

Lengths between 40cm and 46cm dominated the catch, with a clear modal class at 42cm (mean length and weight of 44cm and 845g). In this Div., mean length are no trend in the range 2000-2006 (Fig. 23).

2.2.16. Greenland halibut Div. 3M

Information on length composition of the Greenland halibut catches in Div. 3M is available from January to April (except March) and from July to October (Table XXII, Fig. 17), from 208m to 1180m depth.

Lengths between 40cm and 50cm dominated the catch, with a modal classes at 42cm, 44cm and 46cm (mean length and weight of 46cm and 942g). After a moderate increase between 2000 and 2002, mean length remain stable since then (Fig. 17).

2.2.17. Greenland halibut Div. 3N

Information on length composition of the Greenland halibut catches in Div. 3N is available only for July and October (Table XXIII, Fig. 18) from 438m to 748m depth.

Lengths between 36cm and 46cm dominated the catch, with a clear modal classes at 40cm and 42cm (mean length and weight of 43cm and 769g).

2.2.18. Greenland halibut Div. 3O

Information on length composition of the Greenland halibut catches in Div. 3O is available from October to December (Table XXIV, Fig. 19), from 123m to 750m depth.

Lengths between 34cm and 42cm dominated the catch, with a modal class at 40cm (mean length and weight of 42cm and 699g).

2.2.19. Roughhead grenadier Div. 3L

Information on length composition of the roughhead grenadier catches in Div. 3L is available from January to April and from August to October (Table XXV, Fig. 20), from 645m to 1514m depth.

Anal fin lengths between 11cm and 14cm dominated the catch, with a clear modal class at 12cm (mean length and weight of 14cm and 405g). After presents the same value between 2000 and 2003, since 2004 great oscillations are observed in the mean length.

2.2.20. Roughhead grenadier Div. 3M

Information on length composition of the roughhead grenadier catches in Div. 3M is available from January to April (except March) (Table XXVI, Fig. 21), from 840m to 1180m depth.

Anal fin lengths between 10cm and 13cm dominated the catch, with a clear modal class at 12cm (mean length and weight of 12cm and 312g). Between 2000 and 2004 no trends are observed; after 2004, the mean length follow the same pattern observed in Div. 3L

2.2.21. Witch flounder Div. 3L

Information on length composition of the witch flounder catches in Div. 3L is available from January to April and for August and October (Table XXVII, Fig. 22), from 645m to 1514m depth.

Lengths between 32cm and 38cm dominated the catch, with modal classes at 34cm, 36cm and 38cm (mean length and weight of 37cm and 491g).

2.2.22. Witch flounder Div. 3M

Information on length composition of the witch flounder catches in Div. 3M is available for January, July, August and October (Table XXVIII, Fig. 23), from 208m to 1151m depth.

Lengths between 32cm and 38cm dominated the catch, with a clear modal class at 36cm (mean length and weight of 37cm and 489g).

2.2.23. Witch flounder Div. 3N

Information on length composition of the witch flounder catches in Div. 3N is available only for October and November (Table XXIX-A, Fig. 24A), from 92m to 534m depth.

Lengths between 30cm and 38cm dominated the catch, with a very clear modal class at 36cm (mean length and weight of 35cm and 481g).

2.2.24. Witch flounder Div. 3O

Information on length composition of the witch flounder catches in Div. 3O is available for April, June and July, and from October to December (Table XXX-A, Fig. 25A), from 91m to 710m depth.

Lengths between 34cm and 40cm dominated the catch, with modal classes at 36cm and 38cm (mean length and weight of 38cm and 588g).

2.2.25. White hake Div. 3N

Information on length composition of the white hake catches in Div. 3N is available only for October (Table XXXI, no figure), from 438m to 519m depth.

Because sampling data is based on a very small number of observations (1 sample, 26 fish measured) are no comments.

.

2.2.26. White hake Div. 3O

Information on length composition of the white hake catches in Div. 3O is available from April to July (except March) and from October to December (Table XXXII-A, Fig. 26A), from 161m to 750m depth.

Lengths between 40cm and 47cm and at 49cm and 50 cm dominated the catch, with modal classes at 44cm and 46cm (mean length and weight of 46cm and 1162g).

2.2.27. Thorny skate Div. 3L

Information on length composition of the thorny skate catches in Div. 3L is available from January to April and for October (Table XXXIII, Fig. 27), from 808m to 1557m depth.

Lengths at 36cm, 38cm and 40cm dominated the catch, with a modal class at 40cm (mean length of 37cm).

2.2.28. Thorny skate Div. 3M

Information on length composition of the thorny skate catches in Div. 3M is available for January, April and from July to October , except September (Table XXXIV, Fig. 28), from 170m to 1180m depth.

Lengths at 33cm, 35cm and 36cm dominated the catch, with the modal classes at these values (mean length of 36cm).

2.2.29. Thorny skate Div. 3N

Information on length composition of the thorny skate catches in Div. 3N is available for July, October and November (Table XXXV-A, Fig. 29A), from 62m to 534m depth.

Lengths at 33cm, 35cm, 36cm, 39cm and 40cm dominated the catch, with a modal class at 39cm (mean length of 37cm).

2.2.30. Thorny skate Div. 3O

Information on length composition of the thorny skate catches in Div. 3O is available for April, June and July and from October to December (Table XXXVI-A, Fig. 30A), from 91m to 560m depth.

Lengths at 39cm and 40cm dominated the catch, with a clear modal class at 40 cm (mean length of 37cm).

2.2.31. Spinytail skate Div. 3L

Information on length composition of the spinytail skate catches in Div. 3L is available from January to April and for October (Table XXXVII, Fig. 31), from 808m to 1557m depth.

The lengths range was from 17cm till 80cm (mean length of 44cm).

2.2.32. Spinytail skate Div. 3M

Information on length composition of the spinytail skate catches in Div. 3M is available for April and from July to October, except September (Table XXXVIII, Fig. 32), from 333m to 1180m depth.

The most abundant length classes are at 40cm, 44cm, 46cm, 47cm, 48cm, 51cm, 54cm and 56cm (mean length of 51cm).

2.2.33. Spinytail skate Div. 3N

Information on length composition of the spinytail skate catches in Div. 3N is available for July and October (Table XXXIX, no figure), from 431m to 748m depth.

Because sampling data is based on a very small number of observations (4 samples, 37 fish measured) are no comments about class abundance (mean length of 49cm).

2.2.34. Spinytail skate Div. 3O

Information on length composition of the spinytail skate catches in Div. 3O is available only for October (Table XL, no figure), from 263m to 396m depth.

Because sampling data is based on a very small number of observations (1 sample, 7 fish measured) are no comments about class abundance (mean length of 45cm).

2.2.35. Monkfish Div. 3N

Information on length composition of the monkfish catches in Div. 3N is available only for November (Table XLI-A, no figure), from 283m to 309m depth.

Because sampling data is based on a very small number of observations (1 sample, 17 fish measured) are no comments about class abundance (mean length and weight of 63cm and 6130g)

2.2.36. Monkfish Div. 3O

Information on length composition of the monkfish catches in Div. 3O is available for June and July and from October to December (Table XLII-A, Fig. 33A), from 129m to 620m depth.

The most abundant length classes are at 44cm, 49cm, 52cm and 55cm (mean length and weight of 55cm and 4318g).

Note: Fishing hours and number of nets estimated from their monthly rates to fishing days observed in the trawlers and gillnetters sampled by the IPIMAR.
Monthly effort of gillnetters is given by the sum of nets per fishing day

TABLE II - B: PORTUGUESE TRAWL EFFORT IN FISHING DAYS AND FISHING HOURS IN NAFO SUBAREA 3.
