NAFO SCR Doc. 08/29

SCIENTIFIC COUNCIL MEETING – JUNE 2008

Integrated Science Data Management NAFO Report 2007

Bruce Bradshaw

Integrated Science Data Management (ISDM)
Department of Fisheries and Oceans (DFO)
200 Kent St., Ottawa, Ont. Canada K1A 0E6
E-mail: bruce.bradshaw@dfo-mpo.gc.ca

Abstract

2007 has been a busy year for ISDM that saw many new developments, with expanded roles and responsibilities. While dealing with the inevitable impacts of losing career data managers to retirements and professional growth opportunities we have enjoyed a revitalization that comes with new people, ideas and perspectives. Through the CHS merger we have launched new products, services and distribution channels. DFO is in the process of Science Renewal based on a new habitat management approach that leverages some of the ISDM experience in data management. Our computer, database and programming environments are adapting to significant change driven by departmental service consolidations and internal migrations to new technologies.

ISDM, as the Regional Environmental Data Center for NAFO, is required to provide an annual inventory of environmental data collected in the NAFO area to the NAFO subcommittee for the environment (STACFEN). Inventories and maps of physical oceanographic observations such as ocean profiles, surface thermosalinographs, drifting buoys, currents, waves, tides and water level measurements for the calendar year 2007 are included. This report will also provide an update on other ISDM activities during 2007 and beyond.

It is important for STACFEN to encourage members to send data and information to the designated data center in order to get significant return for NAFO member countries.

Introduction

ISDM, has been recognized since 1975 as the Regional Environmental Data Center for ICNAF and subsequently for NAFO. In order for ISDM to carry out its responsibility of reporting to the Scientific Council, the Designated National Representatives selected by STACFEN are requested to provide ISDM with all marine environmental data collected in the Northwest Atlantic for the preceding years.

Provision of a meaningful report to the Council for its meeting in June 2008 required the submission to ISDM of a completed oceanographic inventory form for data collected in 2007, and oceanographic data pertinent to the NAFO area, for all stations occupied in the year prior to 2007. The data of highest priority are those from the standard sections and stations, as described in NAFO SCR DOC., No. 1, Serial N 1432, 9p.

Data that have been formatted and archived at ISDM are available to all members on request. Requests can be made by telephone (613) 990-0243, by e-mail to isdm-gdsi@dfo-mpo.gc.ca, by completing an on-line order form on the ISDM web site at www.meds-sdmm.dfo-mpo.gc.ca/meds/Contact_US/Request_e.asp or by writing to Services, Integrated Science Data Management (ISDM), Dept. of Fisheries and Oceans, 12th Floor, 200 Kent St., Ottawa, Ont. Canada K1A 0E6.

Data Summaries for 2007

Subsurface profile data

For the NAFO area, subsurface vertical profiles as well as surface observations, sample a variety of parameters such as temperature, salinity, oxygen, nutrients and other chemical and biological variables. ISDM receives these data either in real-time (within one month of observation) via the Global Telecommunications System (GTS) reporting system or in delayed-mode directly from responsible institutions, and indirectly from national Cruise Summary Reports and other reports of marine activities.

The following inventories and corresponding maps summarize the ocean subsurface and surface data processing activities in 2007 for the NAFO area:

- **Table 1, Figure 1: Real-time temperature-salinity profile data collected and processed in 2007**
TOTAL: 159207 profiles (up 84% from 2006)
- **Table 2, Figure 2: Delayed-mode profile data collected and processed in 2007**
TOTAL: 1433 profiles (down 52% from 2006)
- **Table 3, Figure 3: Profile data collected prior to 2007 and processed in 2007**
TOTAL: 6626 profiles (down 72% from 2006)
- **Table 4, Figure 4: Surface Thermosalinograph data collected and processed in 2007**
TOTAL: 24598 stations (none in 2006)

Ocean subsurface data are processed at ISDM in much the same way for each of the data sets described above. Electronic files are converted from a wide range of formats, into a common format. Quality control is carried out by a combination of specially designed software and trained personnel. The quality control has four main functions. The first is to check and ensure that each data message is properly formatted, units are standardized, and parameter range checks are performed. The second is to identify any duplication, and select the best version based on data type, source of the data, and general qualities in analysis and reporting of the observations. The third check identifies and corrects date/time and geographical positioning errors using computer tests and visual inspection of the track for each cruise. The final quality control procedure uses a series of algorithms to find and flag common instrument failures found in profiles of subsurface measurements. Each subsurface profile of temperature, salinity and other subsurface variables, are also visually inspected using software to plot the data and allow a technician to set quality flags to individual points on a profile. http://www.meds-sdmm.dfo-mpo.gc.ca/meds/Databases/OCEAN/QC_e.htm

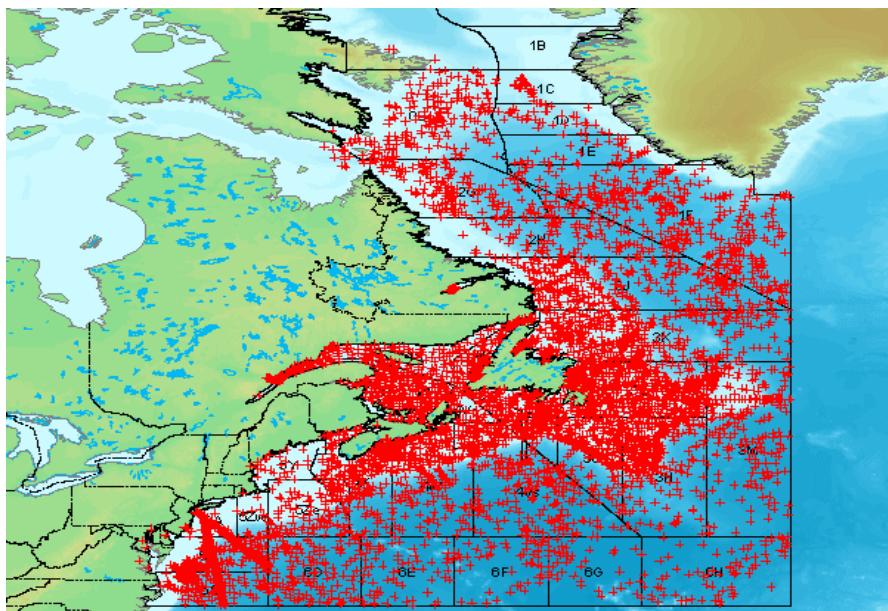

Figure 1: Real Time Temperature-Salinity Stations 2007

Total = 159207 Stations

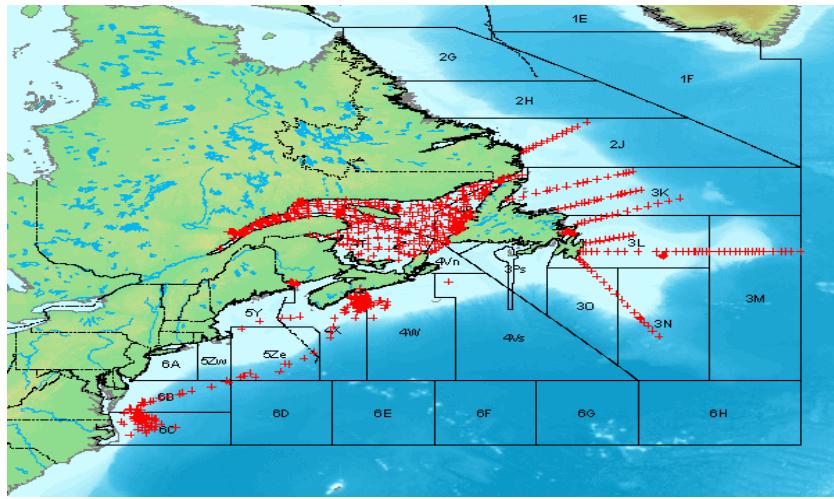

Figure 2: Delayed-mode profile data collected and processed in 2007
Total = 1433 stations (52% less than 2006)

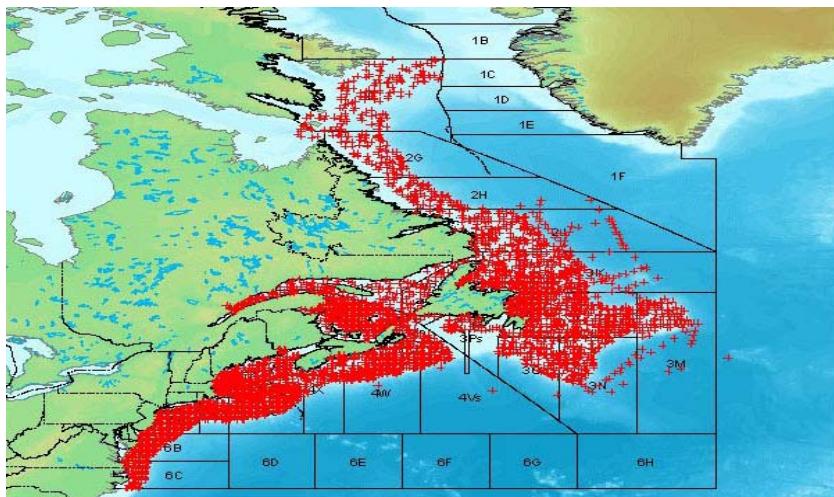

Figure 3: Delayed mode profile stations collected before 2006 and processed in 2007

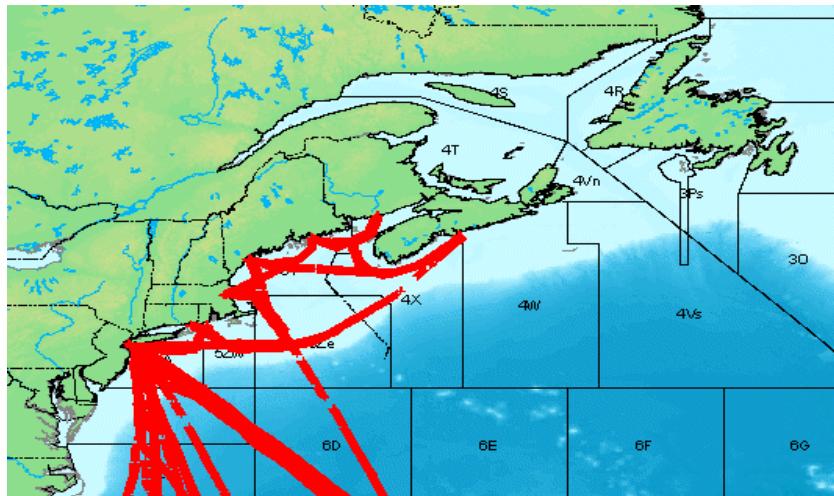

Figure 4: Surface Thermosalinograph data collected and processed in 2007
Total = 24598 Stations (none in 2006)

Drifting Buoy Data

The following inventory and map summarize ISDM drifting buoy data collected and processed in 2007 for the NAFO area:

- **Table 5, Figure 5: Drifting Buoys in the NAFO Area in 2007**

TOTAL = 493636 messages from 208 buoys (50% increase from 2006)

Drifting buoy data are received at ISDM via the GTS. Quality control techniques are much the same as those for the ocean profile data. Drifting buoys report via satellite, at rates of up to every 15 minutes. These messages are checked for format errors, and reformatted for quality control procedures and subsequent archival. Range checks, flags and possible corrections to the data are carried out by trained personnel, using a system of ISDM software, which organize, analyze and display plots of the data. Quality checks use algorithms which check drifting speed and position, and ranges of sea surface temperatures and sea level pressure. The range checks include a comparison to NOAA's Asheville SST Climatology (2.5x2.5 degrees and monthly). Duplicates are checked, which is important for discriminating between data received directly from buoys and messages routed through other data centers. Lower quality data (which are this type of duplicate) are flagged as such.

ISDM drifting buoy archive contains over 70 million records for the world's oceans, from 1978 to present, and is currently growing at a rate of one million messages per month. A drifting buoy message is comprised of the buoy position and one or more of the following parameters: surface and subsurface water temperature, air pressure and temperature, wind speed and direction.

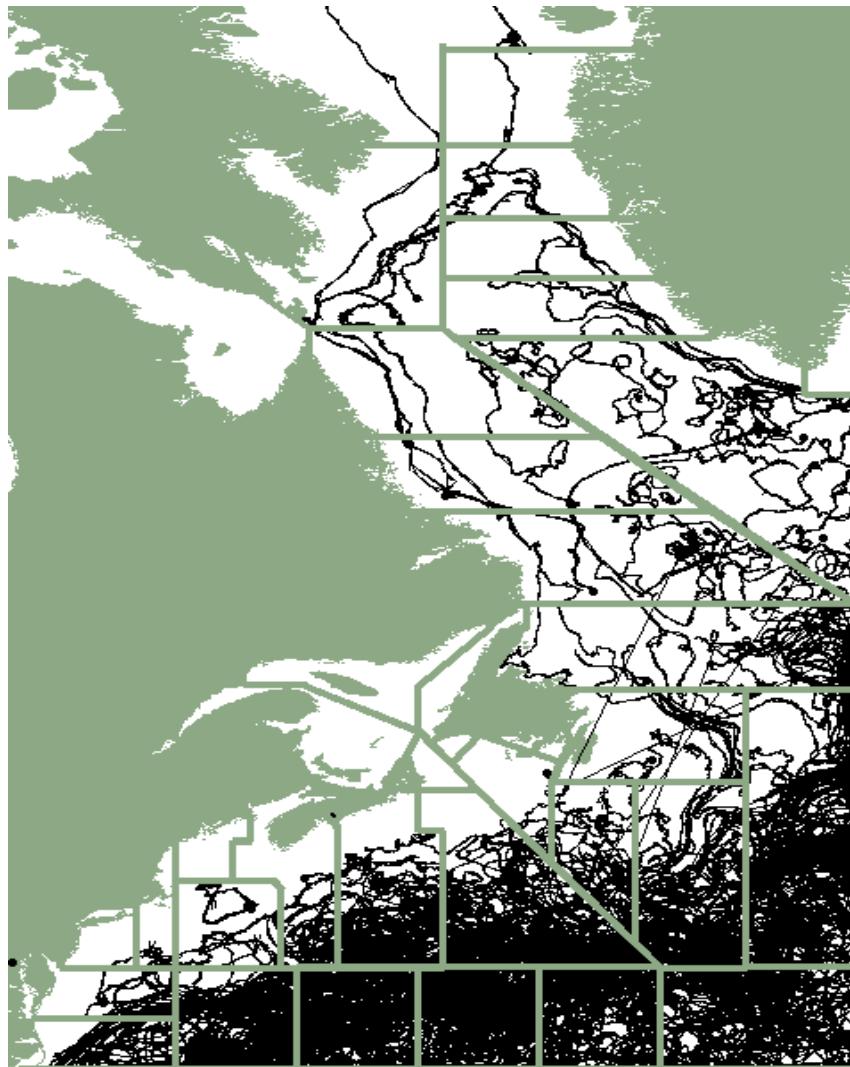

Figure 5: Drifting Buoy messages 2007
Total = 493636 messages (50% more than 2006)

Current Meter Data

The following inventory summarizes current meter data collections in 2007 in the NAFO area:

- **Table 6a, Figure 6:** Current meter data recovered and processed in 2007 (yellow dot ●)
- **Table 6b, Figure 6:** Current meter data recovered 2007 and not yet processed in 2007 (red dot ●)
- **Table 6c:** Current meters deployed and not yet recovered in 2007

Current meters have been deployed in the NAFO area for many years. These data are processed and archived at The Bedford Institute of Oceanography (BIO), Dartmouth, Nova Scotia and are available online at: www.mar.dfo-mpo.gc.ca/science/ocean/home.html.

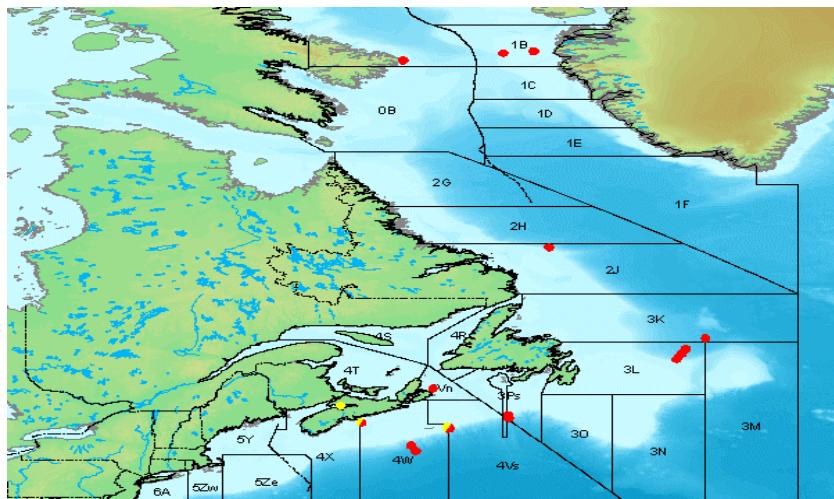

Figure 6: East Coast Current Meters Recovered in 2007

Wave Data

The following map displays where ISDM wave data were collected in 2007:

- **Figure 7: Wave Buoys in the NAFO Area in 2007**

TOTAL = 15 Buoys

Yellow blocks ■ indicate NEB Well sites, red ■ indicate Environment Canada weather buoys

ISDM continued to process and archive operational surface wave data on a daily basis around Canada. Wave spectra, calculated variables such as the significant wave height and peak period, concurrent wind observations, and raw digital time series of water surface elevations are stored. Data are quality controlled with a visual inspection and with ISDM software to set flags on data showing instrument failures. During 2007, data was collected from 13 buoys in the NAFO area. All real-time and historical wave data are made available on-line from ISDM web site: www.meds-sdmm.dfo-mpo.gc.ca/meds/Databases/WAVE/WAVE_e.htm

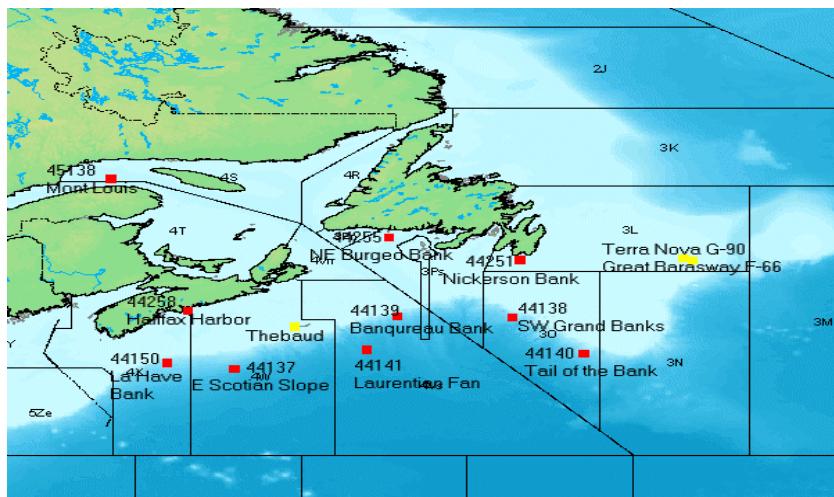

Figure 7: Wave Buoys in the NAFO Area in 2007

Total = 13 buoys

Tide and Water level Data

The following map displays where ISDM tide and water level data were collected from:

- **Figure 8: Tide and water level data in the NAFO Area in 2007**
TOTAL = 16 Gauges

Yellow blocks ■ indicate temporary gauges, red ■ indicate permanent.

ISDM continued to process and archive operational tides and water level data that were reported on a daily to monthly basis from the Canadian water level network. ISDM archived observed heights with up to a 1-minute sampling interval, hourly heights and monthly instantaneous extremes collected around Canada. Approximately 1.3 million new readings were updated every month from the network with the increase in sampling interval. The historical tides and water level data archives presently hold over 435 million records with the earliest dating back before the turn of the century. Data from 96 tide and water level gauges were processed during 2007 with 16 in the NAFO region. The data is quality controlled using ISDM software and is available for download from ISDM web site:

www.meds-sdmm.dfo-mpo.gc.ca/meds/Databases/TWL/TWL_e.htm.

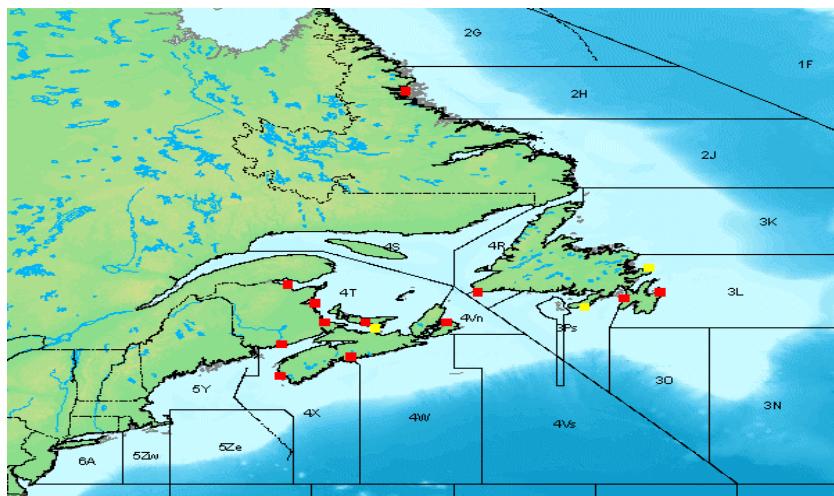

Figure 9: Tide and water level data in the NAFO Area in 2007

Total = 16 gauges (one less than 2006)

Activity Updates

The Argo data system

Argo is an international program to deploy profiling floats on a 3 by 3 degree grid in the oceans of the world. Each profiling float samples and reports both temperature and salinity from 2000m to the surface every 10 days. Some of the newer floats now also report oxygen. Data are distributed on the Global Telecommunications System (GTS) within 24 hours of collection and made available on two Global servers located in France and the US. ISDM role is to carry out the processing of the data received from Canadian floats, to distribute the data on the GTS and the global servers within 24 hours and to handle the delayed mode processing.

ISDM developed a Canadian web site

www.meds-sdmm.dfo-mpo.gc.ca/meds/Prog_Int/argo/ArgoHome_e.html that contains data and information about Canadian floats as well as general information and statistics about the global array. Global information is also available from the Argo Information Centre in Toulouse at argo.jcommops.org.

During 2007, the Canadian Argo program deployed 29 Argo floats in the NAFO region, including 5 oxygen floats and produced 718 temperature and salinity profiles and 134 oxygen profiles. Currently, there are 37 active floats and

39 inactive floats in the NAFO region. Figure 9 shows the Canadian Argo floats deployed in the North Atlantic as of May 2007. The tracks in red indicate floats that are inactive and no longer reporting.

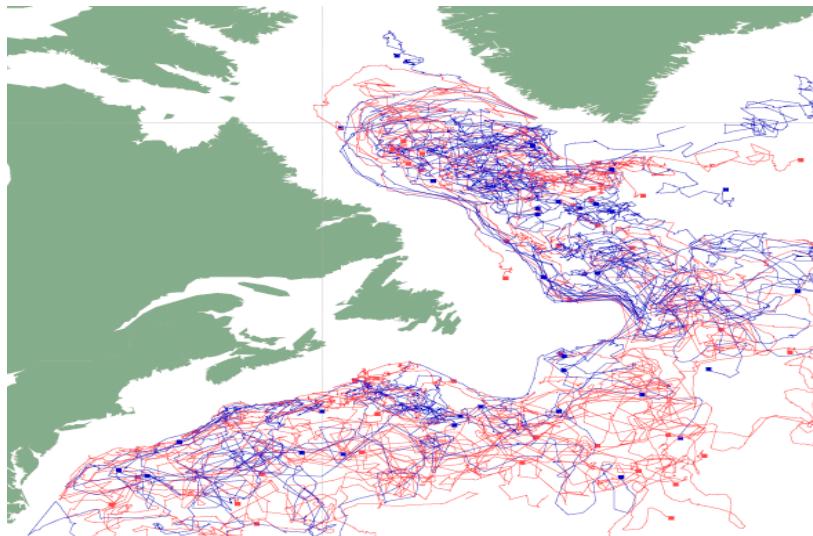

Figure 9: Canadian Argo profiling floats May 2007

Atlantic Zone Monitoring Programme (AZMP)

The DFO Atlantic Zone Monitoring Programme activities include regular sampling for 7 fixed stations and 13 standard sections, and research cruises in the AZMP area to collect other physical, chemical and biological data. As part of ISDM's activities in data management, ISDM continues to build and maintain the AZMP web site: www.meds-sdmm.dfo-mpo.gc.ca/zmp/main_zmp_e.html.

The wealth of data and information on the site includes:

- Physical and chemical data from 1999 to the present such as CTD, bottle and bathythermograph measurements
- Climate indices showing long term trends of physical variables in the areas of Seawater, Freshwater, Ice, Atmosphere
- Water level data for 9 gauges ranging from 1895 to present
- Graphical representations of biological data (phytoplankton, zooplankton) -Remote Sensing links for Ocean Colour, SST and Primary Productivity product

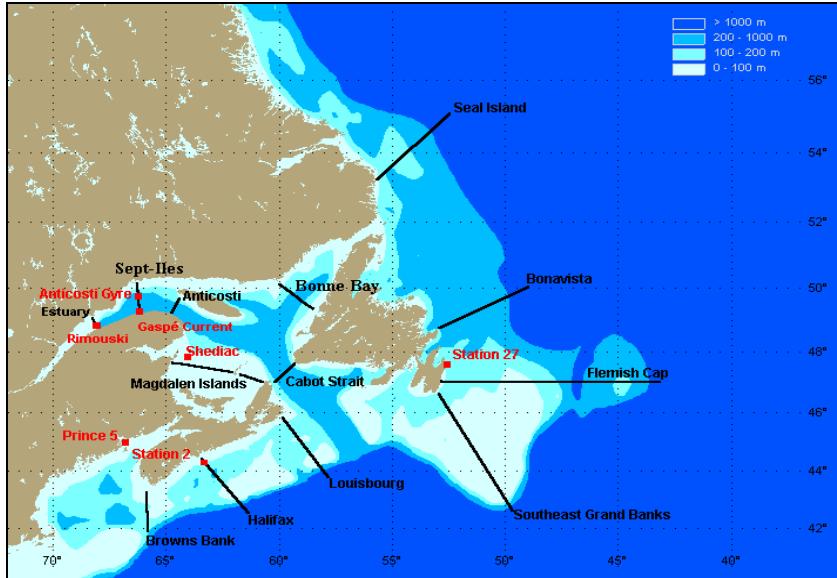

Figure 10: Map of AZMP sections and stations

Centre for Ocean Model Development and Application (COMDA)

DFO has created a virtual Centre for Ocean Model Development and Application (COMDA) with a mandate to provide national leadership, coordination and advice in areas of ocean model development and application that are departmental priorities. COMDA will be leading and assisting in the development and execution of different scientific projects. One of the initial and major projects includes "Ocean Modelling for Benthic Habitat Mapping" in collaboration with NRCan to provide a quantitative representation of ocean current and waves influences on the seabed surrounding Canada. Other projects are listed here: <http://www.mar.dfo-mpo.gc.ca/science/ocean/comda/comda-e.html>

ISDM's involvement with COMDA will be to provide data streams of temperature and salinity for model initialization and data assimilation. This step involves creation of three-dimensional fields of temperature and salinity that represent the real-time state of the ocean. This is done by integrating all real-time data sources that are received, controlled or processed at ISDM. The scientific method behind this integration is called objective analysis. The depth levels can be targeted according to the needs of scientists and other clients. Figure 11 illustrates the current daily analysis of temperature and salinity at 10 and 300 metres depth.

One by-product of this operation is the capability of generating very accurate fields of temperature and salinity for periods from the recent past, using all data that was available at the time and that has been coming to ISDM since (delayed mode, calibrated data).

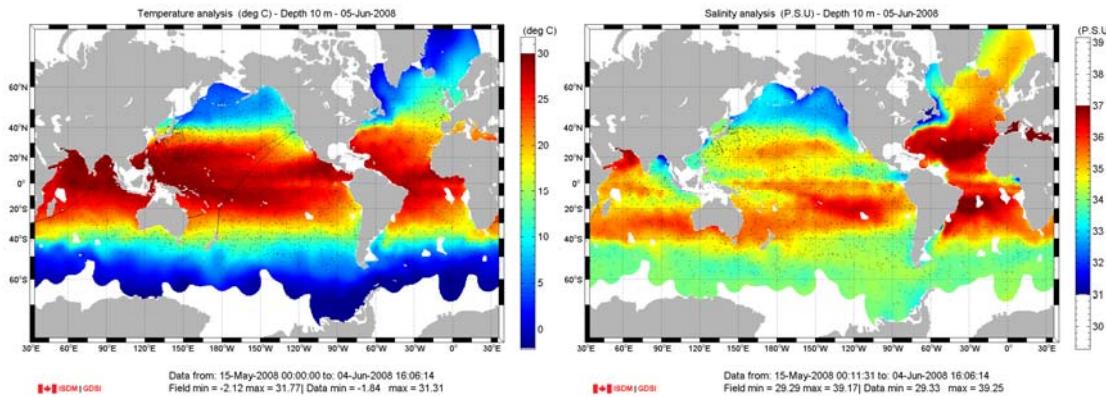

Figure 11: COMDA/OI Climatology analysis for June 5, 2008 at 10m depth

Aquatic Invasive Species (AIS)

Aquatic Invasive Species are a major threat to Canada's fisheries and aquaculture industry and have been entering Canadian waters for centuries but never as rapidly as today. Every decade, some 15 alien species establish themselves in our coastal or inland waters. In the absence of their natural predators, the most aggressive of them spread rapidly. They can radically alter habitat, rendering it inhospitable for native species. The zebra mussel and sea lamprey are examples of such species that have greatly affected the Great Lakes.

The most effective approach to dealing with this threat involves managing the pathways through which invasive species enter and spread through Canadian waters. For aquatic species these pathways are shipping, recreational and commercial boating, the use of live bait, the aquarium/water garden trade, live food fish, unauthorized introductions and transfers, and canals and water diversions. The shipping pathway is considered the largest single source of new aquatic invasive species. Ballast water that is taken on in foreign ports, for ship stability and safety at sea, is discharged in Canadian waters, along with undesirable "hitchhikers" - foreign species ranging from bacteria to larger organisms.

The Canadian Aquatic Invasive Species database and web application was developed in 2004-5. The main objective was to provide a geo-referenced repository for all invasive species observations gathered in Canada by DFO scientists, provincial departments, other federal or municipal departments and the general public. The second objective was to create a decision making tool that would allow the production of augmented value products that would illustrate trends and movements over time and various locations and thus allow the department to be proactive rather than reactive to observations made.

Currently there is data from the Great Lakes, the Maritimes and some from the Vancouver area. Most of the data are observations of location name, long-lat, species name, date, and any metadata provided.

National Science Data Management Committee (NSDMC)

This committee continues with funding and has a well developed funding process. In 2007, 21 projects were funded with 7 targeted at improved access to data and information, 11 to upgrading archives or inserting unarchived data, 2 targeted at addressing standards, and some funding for meetings. Types of data included bathymetry, pCO₂ measurements, Arctic fisheries data, zooplankton, marine mammals and nutrients. Access projects addressed creation of inventory records and software, support to OBIS, a general access system to fisheries data and continuing development of a services oriented architecture.
