Av. BRASÍLIA 1449-006, LISBOA, PORTUGAL

A. Status of the fisheries

In 2011, the Portuguese provisional nominal catches proceeding from NAFO Regulatory Sub Area 3 reached 17 730 ton (Table 1-A). Over recent years, nominal catches increased continuously from 2000 to 2003, when they peaked at 21 300 ton, but declined sharply afterwards; between 2004 and 2008 catches stabilised between 11 500-13 000 ton. Catches in 2009 and 2010 were around 15 000 ton (Table I-B).

Based on provisional effort data, the number of fishing days, both in Div. 3L and 3O, decreased from 2010 to 2011, however the effort in Div. 3M and 3N increased significantly leading to an increase in total effort in 2011. In 2011, 11 trawlers composed the Portuguese fleet that operated in the NAFO area.

Due to the opening, in 2010, of the fishery for cod in Div. 3M (Flemish Cap), this species represent now 29% of the total catch in this division and almost 18% of the Portuguese catches from subarea 3. Catches of redfish remains stable in Div. 3O and fall by half in Div. 3N, but the total catch of this species was kept at the same level due to the increase observed in Div. 3M. Redfish continues to be by far the most important species in the Portuguese commercial catches from Sub Area 3, representing in recent years more than 50% of the overall catch.

The by-catch of American plaice in Div. 3N doubled from 2010 to 2011. The same increase was observed for the roughhead grenadier catch in Div. 3L and 3M. The shrimp fishery in Div. 3L, that in 2009 its catches reached 20% of the total catch in this division, declined significantly in 2010 and was reduced to zero in 2011.

Like in 2010, the Greenland halibut catch increased around 9% in 2011, but due to the increase observed in both Div. 3M and 3N (more than 50% increase for the two divisions combined) On Div. 3L, the bulk of the catch is again of Greenland halibut and redfish (around 90%).

The catches of other species remained more or less stables in all divisions.

The catch in Div. 3M (mainly cod and redfish) continue, like the most recent years, to represent around 50% of the total catch in 2011. This division is at present the most important ground for the Portuguese NAFO fishery. On both Div. 3M and 3O, redfish is the most important fishery, with an average of 75% of the total catch in each division. For the second year in Div. 3N, the redfish fishery is the most important fishery (53% of the total catch in 2011 against 84% in 2010, due to rising of the by-catch of American plaice), replacing the skate fishery that for several years represented 50-70% of the catch in this division.

B. Portuguese Annual Sampling Program

1. Catch and effort sampling.

Effort and CPUE data for 2011 Portuguese trawl fishery on the NAFO Regulatory Area were obtained through the revision of skipper logbooks from two trawlers, kindly supplied by its owners. All the information (round weight of the catch by species, fishing effort, positions and depths) has been recorded on a tow-by-tow basis. The vessel conversion factors were used to convert its processed landings in catches. Effort data in days and hours were supplied by the Portuguese administration, changes in the administration database make it possible since 2009 (Table II-A/B).

The daily catch and effort data from the logbooks were used to estimate the directed effort and CPUE for each of the target species/stock, as well as the main by-catch species and depth range of the different fisheries, on a monthly basis. From the data available, the majority of the fishing effort was directed towards redfish, Greenland halibut and cod. Data regarding directed effort and catch rates of the Greenland halibut fishery are presented in Table III to IV-B and Fig. 1.

The Greenland halibut CPUE series was updated with the 2011 observed CPUEs. The additive model (Ávila de Melo and Alpoim, 1995), was upgraded in 1998 (Alpoim *et al.*, 1998) and used, like in previous years, to standardise the observed CPUEs, but excluding the vessel factor because the sampling program in recent years was carried out on vessels that were not sampled before. If the vessel factor is applied, these new vessels will increase a lot the noise. Because they are the only vessels sampled in the recent years, we assumed that all vessels belong to the same category what is realistic. From January 1988 till April 1995 each monthly observed CPUE of this series was previously corrected for 130mm mesh size (Ávila de Melo and Alpoim, 1996). In this analysis, any observation corresponding to a month and a trawler with less than 10 hours of directed effort was rejected. The CPUEs are presented in Tables IV and Fig. 1, with the associated standard errors (+/- 2 standard errors in the Figures) and coefficients of variation.

1.1. Comments on catch and effort data (based on the vessels sampled)

1.1.1. Greenland halibut in Div. 3L, 3M, 3N and 3O

In Div. 3L catch rates declined prior to the boom of the deep-water fishery (Table IV-A, Fig. 1). However, it is from 1990 to 1991, i.e. from the first to the second year of this new fishery in the Regulatory Area, that CPUEs fell by half. Between 1991 and 1994 catch rates remained stable at a low level. Since then, catch rates gradually increased, reaching an upper level in 1999-2000. Catch rates declined in 2001 and remained stable at that lower level in 2002 and 2003. In 2004 the catch rates decline again, reaching the lowest value since 1994. However, after 2004 the Greenland halibut catch rates recovered continuously and despite the high variability from 2007 to 2011 the catch rates reached the highest values observed since the monitoring of this fishery.

Div. 3M catch rates despite more noisy follows the same trend as the ones in Div. 3L.

For all Div. 3LMNO combined (Table IV-A, Fig. 1) the observed catch rates series follows the Div. 3L pattern, since this is the division of Sub Area 3 with the highest concentration of Greenland halibut fishing effort.

2. Biological Sampling

In 2011, biological sampling was obtained from two stern trawlers fishing in Div. 3L, 3M, 3N and 3O during all the year. Apart from species under moratoria, a priority to be sampled whenever they appear in the hauls, biological sampling was conducted for the two most abundant species in each haul, following the NAFO sampling recommendations.

Cod, redfish (*S. mentella*), Greenland halibut and American plaice were sampled in Div. 3L, 3M, 3N and 3O (Tab. V). Thorny skate was sampled in Div. 3M, 3N and 3O. Roughhead grenadier was sampled in Div. 3L and 3M. Witch flounder was sampled in Div. 3N and 3O. Redfish (*S. marinus*) was sampled only in Div. 3M. Yellowtail flounder was sampled only in Div. 3N. White hake was sampled only in Div. 3O.

Since 1996, all commercial information is representative of the catch as a whole, although sampling continues to be carried out by sex with the exception of cod, white hake, Atlantic halibut and haddock. Mean weight and mean weight in the catch are derived from the length-weight relationships calculated from the commercial sampling in 2011 (Table VI). However, due to some lack of sampling during 2011, for some stocks the length weight relationships used were the ones calculated in previous years.

2.1. Catch and bycatch composition of the 2011 trawl fishery (130mm codend mesh size).

The regular mesh size in the codend used by the monitored trawlers fishing groundfish was the 130mm and, when the mesh size is not mentioned it, means that the sample refers to the 130mm mesh size. Nevertheless, some sets in Div. 3N were made with a skate trawl net with 200mm/280mm mesh size in the codend, representing 4% in Div. 3N of the total effort sampled. In these sets the main species were sampled. The size of these catches within the overall sampled catch in Div. 3N is about 1% for cod, 25% for American plaice, 40% for yellowtail flounder and 64% for thorny skate.

2.1.1. Cod Div. 3L

Information on length composition of the cod by-catch in Div. 3L is available from May to August, except for July (Table VII, Fig. 2), from 342 m to 512 m depth.

Lengths between 36 cm and 45 cm dominated the catch, with a modal class at 39 cm (mean length and weight of 46.6 cm and 1020 g).

2.1.2. Cod Div. 3M

Information on length composition of the cod trawl catch in Div. 3M is available from February to October, except for April and July (Table VIII-A, Fig. 3a), from 210 m to 707 m depth.

Lengths between 42 cm and 54 cm dominated the catch, with a modal class at 54 cm (mean length and weight of 52.7 cm and 1489 g).

The Div. 3M cod age-length keys for the 3rd and 4th Trimester are presented in Table VIII-B and C. The 3rd Trimester age-length key was applied to the 1st and 2nd Trimesters length frequencies to derive the age frequencies.

The 2009-2005 year classes, 2 to 6 years old in 2011, dominated the trawl catches, being the 2008 year class the most represented (Tab. VIII-D, Fig. 3b).

2.1.3. Cod Div. 3N

Information on length composition of the cod by-catch in Div. 3N is available for February, May and June (Table IX-A, Fig. 4a), from 81 m to 596 m depth.

Lengths between 33 cm and 42 cm dominated the catch, with a two clear modal classes at 36 cm and 39 cm (mean length and weight of 40 cm and 710 g).

2.1.4. Cod Div. 3N (200mm codend mesh size)

Information on length composition of the 200mm mesh size cod by-catch in Div. 3N is available only for June (Table IX-B, Fig. 4b), from 50 m to 77 m depth.

Lengths at 57 cm, 60 cm and 81 cm dominated the catch (mean length and weight of 70.4 cm and 4615 g).

2.1.5. Cod Div. 3O

Information on length composition of the cod by-catch in Div. 3O is available for February, May and June (Table X, Fig. 5), from 95 m to 589 m depth.

Lengths between 39 cm and 48 cm dominated the catch, with a very clear modal class at 48 cm (mean length and weight of 48.4 cm and 1535 g).

2.1.6. Redfish (*S. mentella*) Div. 3L

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3L is available for March, May, June and August (Table XI, Fig. 6), from 342 m to 549 m depth.

Lengths between 21 cm and 23 cm dominated the catch, with a modal class at 22 cm (mean length and weight of 25.2 cm and 248 g).

2.1.7. Redfish (*S. mentella*) Div. 3M

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3M is available from February to June (except April) and for August and September (Table XII, Fig. 7), from 237 m to 1082 m depth.

Lengths between 21 cm and 23 cm and between 30 cm and 33 cm dominated the catch, with two modal classes at 22 cm and 32 cm (mean length and weight of 26.8 cm and 307 g).

2.1.8. Redfish (*S. mentella*) Div. 3N

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3N is available for February, May and June (Table XIII, Fig. 8), from 220 m to 565 m depth.

Lengths between 21 cm and 23 cm dominated the catch, with a very clear modal class at 22 cm (mean length and weight of 23.3 cm and 192 g).

2.1.9. Redfish (*S. mentella*) Div. 3O

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3O is available for February and from May to August, except for July (Table XIV, Fig. 9), from 230 m to 589 m depth.

Lengths between 19 cm and 22 cm dominated the catches, with a clear modal class at 21 cm (mean length and weight of 22 cm and 145 g).

2.1.10. Redfish (*S. marinus*) Div. 3M

Information on length composition of the redfish (*S. marinus*) trawl catches in Div. 3M is available from August to October (Table XV, Fig. 10), from 226 m to 737 m depth.

Lengths between 25 cm and 34 cm dominated the catch (mean length and weight of 30.9 cm and 441 g).

2.1.11. American plaice Div. 3L

Information on length composition of the American plaice by-catch in Div. 3L is available only for May (Table XVI, Fig. 11), from 455 m to 488 m depth.

Despite the small sampling (1 sample, 121 fish measured), data shows that the lengths between 22 cm and 30 cm dominated the catch (mean length and weight of 28.5 cm and 236 g).

2.1.12. American plaice Div. 3M

Information on length composition of the American plaice by-catch in Div. 3M is available only for September (Table XVII, Fig. 12), from 266 m to 316 m depth.

Despite the small sampling (1 sample, 127 fish measured), the data shows that the lengths between 26 and 32 cm dominated the catch (mean length and weight of 30.3 cm and 225 g).

2.1.13. American plaice Div. 3N

Information on length composition of the American plaice by-catch in Div. 3N is available for February, May and June (Table XVIII-A, Fig. 13a), from 85 m to 533 m depth.

Lengths between 24 cm and 28 cm dominated the catches, with a clear modal class at 26 cm (mean length and weight of 30 cm and 305 g).

2.1.14. American plaice Div. 3N (200 mm codend mesh size)

Information on length composition of the 200 mm mesh size American plaice by-catch in Div. 3N is available only for June (Table XVIII-B, Fig. 13b), from 50 m to 77 m depth.

Lengths between 26 cm and 42 cm dominated the catch, with a modal class at 32 cm (mean length and weight of 35.9 cm and 484 g).

2.1.15. American plaice Div. 3O

Information on length composition of the American plaice by-catch in Div. 3O is available for February, May and June (Table XIX, Fig. 14), from 95 m to 522 m depth.

Lengths between 30 cm and 36 cm dominated the catch, with a modal class at 32 cm (mean length and weight of 33.8 cm and 391 g).

2.1.16. Yellowtail flounder Div. 3N

Information on length composition of the yellowtail flounder catch in Div. 3N is available only for June (Table XX-A, Fig. 15a), from 85 m to 110 m depth.

Despite the small sampling (1 sample, 270 fish measured), the data shows that the length range of the catch was mainly between 30cm and 34 cm (mean length and weight of 33.3 cm and 336 g).

2.1.17. Yellowtail flounder Div. 3N (200 mm codend mesh size)

Information on length composition of the 200 mm mesh size Yellowtail flounder catch in Div. 3N is available only for June (Table XX-B, Fig. 15b), from 50 m to 60 m depth.

Despite the small sampling (1 sample, 188 fish measured), data show that 28-30 cm length classes dominated the catch (mean length and weight of 30.4 cm and 258 g).

2.1.18. Greenland halibut Div. 3L

Information on length composition of the Greenland halibut catches in Div. 3L is available from February to May (except April) and for August and September (Table XXI, Fig. 16), from 886 m to 1506 m depth.

Lengths between 38 cm and 50 cm dominated the catch, with a modal class at 44 cm (mean length and weight of 44.1 cm and 682 g).

2.1.19. Greenland halibut Div. 3M

Information on length composition of the Greenland halibut catches in Div. 3M is available for February, March, August and September (Table XXII, Fig. 17), from 277 m to 1540 m depth.

Lengths between 32 cm and 46 cm dominated the catch, with a clear modal class at 44 cm (mean length and weight of 42.2 cm and 602 g).

2.1.20. Greenland halibut Div. 3N

Information on length composition of the Greenland halibut catches in Div. 3N is available only for February (Table XXIII, Fig. 18), from 798 m to 844 m depth.

Despite the small sampling (1 sample, 156 fish measured), the data shows that the lengths at 34 cm and 38 cm dominated the catch (mean length and weight of 38.8 cm and 429 g).

2.1.21. Greenland halibut Div. 3O

Information on length composition of the Greenland halibut catches in Div. 3O is available only for August (Table XXIV, Fig. 19), from 391 m to 531 m depth.

Lengths between 42 cm and 48 cm dominated the catch, with a modal class at 48 cm (mean length and weight of 47 cm and 823 g).

2.1.22. Roughhead grenadier Div. 3L

Information on length composition of the roughhead grenadier catches in Div. 3L is available from March, May, August and September (Table XXV, Fig. 20), from 886 m to 1492 m depth.

Anal fin lengths between 11 cm and 13 cm dominated the catch, with a very clear modal class at 12 cm (mean length and weight of 13.1 cm and 227 g).

2.1.23. Roughhead grenadier Div. 3M

Information on length composition of the roughhead grenadier catches in Div. 3M is available for August and September (Table XXVI, Fig. 21), from 685 m to 1222 m depth.

Anal fin lengths between 11 cm and 13 cm dominated the catch, with a very clear modal class at 12 cm (mean length and weight of 13.2 cm and 213 g).

2.1.24. Witch flounder Div. 3N

Information on length composition of the witch flounder by-catch in Div. 3N is available only for February (Table XXVII, Fig. 22), from 798 m to 844 m depth.

Despite the small sampling (1 samples, 136 fish measured), the data shows that lengths at 28 cm, 32 cm, 38 cm and 42 cm dominated the catch (mean length and weight of 36.5 cm and 536 g).

2.1.25. Witch flounder Div. 3O

Information on length composition of the witch flounder by-catch in Div. 3O is available for February, May and June (Table XXVIII, Fig. 23), from 95 m to 589 m depth.

Lengths between 26 cm and 32 cm dominated the catch, with a modal class at 28 cm (mean length and weight of 31.6 cm and 389 g).

2.1.26. Thorny skate Div. 3M

Information on length composition of the thorny skate catches in Div. 3M is available from May to September, except for July (Table XXIX, Fig. 24), from 260 m to 717 m depth.

The data shows that 60-62 cm length classes dominated the catch with a modal class at 60cm (mean length and weight of 62.2 cm and 3296 g).

2.1.27. Thorny skate Div. 3N (200 mm codend mesh size)

Information on length composition of the 200 mm mesh size thorny skate catches in Div. 3N is available only for June (Table XXX, Fig. 25), from 66 m to 77 m depth.

Data available come from only one sample (35 fish measured), length ranged from 32 cm to 82 cm with a modal class at 60cm (mean length and weight of 61.8 cm and 3274 g).

2.1.28. Thorny skate Div. 3O

Information on length composition of the thorny skate catches in Div. 3O is available for May and June (Table XXXI, Fig. 26), from 120 m to 265 m depth.

The data show that the length range was from 30 cm to 84 cm (mean length and weight of 61.9 cm and 3409 g).

2.1.41. White hake Div. 3O

Information on length composition of the white hake catches in Div. 3O is available for February, May and June (Table XXXII, Fig. 27), from 95 m to 589 m depth.

Despite the large range of lengths, the data show that lengths at 48 cm, 49 cm, 52 cm and 55 cm dominated the catch (mean length and weight of 50.1 cm and 1126 g).

3. Acknowledgements

This study was supported by the European Commission (Program for the Collection of Data in Fisheries Sector) and INRB/IPIMAR. We thank to Dr. A. Vázquez from Instituto Investigación Mariñas, Vigo, Spain, for ageing 3M cod otoliths from the Portuguese commercial catches.
