

SCIENTIFIC COUNCIL MEETING – JUNE 2012

Spanish Research Report for 2011

by

F. González-Costas¹, D. González-Troncoso¹, G. Ramilo¹, E. Román¹, J. Lorenzo¹, M. Casas¹, C. Gonzalez¹, A. Vázquez², and M. Sacau¹.

¹ Instituto Español de Oceanografía, Vigo, Spain

² Instituto de Investigaciones Marinas, Vigo, Spain

Spanish catch information used in this Report is based on the Provisional STATLANT 21 A contributed by the Spanish Administration. Table 1 presents the catches by species and Division in 2011 based on this information. The split of catches between the different gears and the effort information in this Report are based on information from NAFO observers on board. In 2011 information from 1618 days was available while total effort of the Spanish fleet in NAFO Regulatory Area was 1,667 days (97% coverage).

In addition to NAFO observers, IEO scientific observers were on board 336 fishing days that it means 20 % of the Spanish total effort. All length, age and biological information presented in this paper is based on sampling carried out by IEO scientific observers: 393 samples were taken in 2011, with 49,934 individuals of different species examined (Table 2).

SUBAREA 3

A. Status of the fisheries

A total of 14 Spanish trawlers and 1 pair trawler operated in NAFO Regulatory Area, Div. 3LMNO, during 2011, amounting to 1,667 days (25,276 hours) of fishing effort. Table 3 presents the Spanish effort (fishing hours) since 2003 in NAFO Regulatory Area (NRA) Subarea 3. In 2011, Spanish effort increased 11% in this Area in relation with 2010 effort. Total catches (Table 1) for all species combined in Div. 3LMNO were 17,897 tons in 2011.

Table 4 shows the effort (hours) by quarter and Division and their percentage. Table 5 presents the percentage of the effort by Division and mesh size and Figure 1 shows the NAFO Observers hauls position made with the different mesh sizes (footprint) by the Spanish fleet in 2011.

These tables and figure show that the Spanish fleet has, at least, five different fisheries in NAFO Subarea 3 characterized by different mesh size, target species, depth and fishing area. The main Spanish fisheries and effort in NAFO area were the following: in Div. 3LM, the effort is mainly directed to Greenland halibut using 135 mm cod-end mesh size at more than 700 m depth, alternating with the skate fishery in the second half of the year (Div. 3NO) using 280 mm cod-end mesh size at less than 200 m depth, shrimp fishery (Div. 3LM) using 40 mm cod-end mesh size at 200-600 m depth, redfish (Div. 3O and Div. 3M) using 135 mm cod-end mesh size at 200-700 m depth and Cod in Division 3M using mesh size of 135 mm at 100-400 m depth. This last is a traditional fishery that was closed in 1999 and was reopened in 2010.

Effort and fisheries by Division were: in Div. 3L, most of the effort was performed at more than 700 meters depth using cod-end mesh size of 135 mm, indicating that the fleet targeted Greenland halibut. In the first quarter of the year a small part of the effort was directed to the shrimp fishery at less than 600 meters. Regarding Div. 3M, most of the effort was carried out using 135 mm cod-end mesh size at more than 700 m depth targeting Greenland halibut and in less degree at depths less than 700 m targeting redfish and cod. In 2011 part of the effort directed to cod was

made by a pair trawler. In Div. 3N and during the first half of the year, most of the effort was carried out using 135 mm and in less degree with 280 mm cod-end mesh size, which indicates that the fleet targeted mainly Greenland halibut in depth more than 700 m and in less proportion skate in depth less than 200 m. However, during the second half of the year most part of the effort moved to depths less than 200 m where the skate fishery took place using 280 mm mesh size. Fishing effort in Div. 3O was limited (3%) and targeting redfish, using mainly 135 mm mesh size (89%) and in less proportion skates using mainly 280 mm mesh size (11%).

In addition to NAFO observers (NAFO Observers Program), 8 IEO scientific observers were onboard Spanish vessels, comprising a total of 336 observed fishing days, around 20% coverage of the total Spanish effort. Besides recording catches, discards and effort, these observers carried out biological sampling of the main species taken in the catch. For Greenland halibut, roughhead grenadier, American plaice and cod this includes recording weight at length, sex-ratio, maturity stages, performing stomach contents analyses and collecting material for reproductive studies. Otoliths of these four species were also taken for age determination. In 2011, 393 length samples were taken, with 49 934 individuals of different species examined to obtain the length distributions (Table 2). Length and age distributions presented in this paper are based on sampling carried out by these observers. Length-weight relationships parameters used to calculate the Sum Of Products (SOP) of the length distribution are shown by species in Table 6.

The Spanish activity en NAFO Regulatory Area (NRA) Subarea 3 in 2011 stock by stock was the following:

Cod

Div. 3NO: In Div. 3N, the most important part of the catches of this species were taken as by-catch in the skate fishery (280 mm mesh size) and in less degree in Greenland halibut fishery. Few catches were taken in Div. 3O. Table 7 shows the catch length distribution for Div. 3NO cod. All length distribution samples came from the skate fishery (280 mm mesh size) in Div. 3N. The bulk of the catches are comprised in the 64-88 cm range.

Div. 3M: Catches in Div. 3M were 1,735 tons and were taken in the reopen direct fishery. The legal mesh size of the Cod fishery is 130 mm. In 2011 one pair trawler participated in the fishery catching 365 tons. Pair trawler and trawlers have quiet different length distributions. Pair trawlers catch bigger fish and do not catch fish less than 50 cm. The total length distributions of the Spanish catches are presented in Table 8 and we can observe that most of the catches are comprised in the range of 50-80 cm.

Redfish

Div. 3LN: Spanish catches in 2011 were 44 tons. Most of the catches were taken as by-catch in the Greenland halibut fishery in Div. 3L. Table 9 shows the length distribution for Div. 3LN based on only three samples although the SOP is quit consistent.

3M: In Div. 3M the redfish catches in 2011 have been 340 tons and most of them were catch in a direct fishery. Table 10 shows the Spanish catches length distribution for redfish Division 3M and it can be observed that the bulk of the catches are in the 25-37 cm range.

Div. 3O: A directed fishery for this species took place in Div. 3O mostly in the second half of this year. Catches have reached 1,661 tons in this Division, most of them with 135 mm mesh size. Catches length distribution for Div. 3O are presented in Table 11 and it can be observed that are smaller (15-30 cm) than the observed 3M and 3LN length distributions. The length distribution SOP for this Division is very high and it is a signal of some problems with the samples that it could be not representative of the total catches.

American plaice

Div. 3LNO: Spanish catches in 2011 in Div. 3LNO were 566 tons. Most of the catches were taken as by-catch of the skate (430 tons) and in less degree in Greenland halibut fishery (136 tons). Length distributions in the skate fishery have a bigger length range than in the Greenland halibut fishery. Table 12 presents the total length distribution for Div. 3LNO. It can be observed a clear different length between sexes, males are smaller than females. The bulk of catches were in the range of 25-50 cm.

Div. 3M: Catches in Div. 3M only amounted 12 tons and were taken as by-catch of the Greenland halibut fishery. There is not available length distributions for Division 3M.

Witch flounder

Div. 2J and 3KL: Spanish catches for this stock in 2011 were 52 tons and were taken in the small part of NAFO Regulatory Area (NRA) of Div. 3L as by catch of the Greenland halibut fishery. Length distributions of catches are presented in Table 13 and are based only on two samples.

Div. 3M: This species in this Division is also taken as by-catch in the Greenland halibut and redfish fishery. Catches this year were 147 tons and there is not management stock for this species in this Division. In 2011 there were not available catch length distribution samples.

Div. 3NO: Catches in this Division is taken as by-catch in the Greenland halibut (137 tons) and skate fishery (103 tons). The skate fishery lengths for this species are bigger than the Greenland halibut fishery lengths. Table 14 shows the total Spanish length distribution for this species.

Yellowtail flounder

Div. 3LNO: In 2011 the yellowtail flounder Spanish catches were 779 tons. Most of the catches were taken in Div. 3NO in the skate fishery (729 tons) as by-catch. There were not catches in Div. 3L. Length distributions for yellowtail flounder in Div. 3LNO are presented in Table 15, all length samples were taken in Division 3N. Most of the catches are in the 24-45 cm length range.

Greenland halibut

Subareas 2 and Div. 3KLMNO: Greenland halibut continues to be one of the main target species for the Spanish fleet in NAFO area. A great reduction of effort in this fishery has been carried out in the last years by the Spanish fleet to adapt to the NAFO Greenland halibut recovery plan. In 2011 Spanish catches were 4,740 tons; most of them have been taken in the Flemish Pass area (Div. 3LM) at depths more than 700 m. The mesh size used for this fishery was equal to or greater than 130 mm. Tables 16 shows the length distributions of Spanish catches by Division (3L, 3M and 3NO) and the total length distributions of Spanish catches in Divisions 3LMNO. Most of the catches were in the 35-65 cm length range and the mode of the length distribution was in 50 cm. Total age composition based in the commercial Spanish Age Length Key (ALK), mean weight and mean length at age for Div. 3LMNO are presented in Table 17. Most of the Greenland halibut catches corresponds to ages 5 to 8, with a peak at ages 6-7.

Figure 2 presents the Spanish fleet standardised CPUE updated with the 2011 data presented by Gonzalez-Costas and Gonzalez-Troncoso (2009). Results show that CPUE has decreased in the last year but it is at a similar level of the 2007-2010 period and at high level compare with the levels before 2007.

Thorny skate

Commercial catches of skates comprise a mix of skate species (*Raja radiata*, *Bathyraja spinicauda*, *Raja hyperborean*, *Raja senta*, etc). Thus the catch of skate in Table 1 refers to *Raja* spp. However, thorny skate dominates, comprising about 95% of the skate taken in the Spanish catches.

Div. 3LNO: Spanish skate catches in 2011 were 4,978 tons. Most of the catches were taken in Div. 3N at depths less than 200 meters, where a fishery directed to thorny skate took place mainly in the second semester of the year, using 280 mm mesh size. Skate catches in Div. 3L (44 tons) were much smaller than those in Div. 3NO and they were by-catch of the Greenland halibut fishery (135 mm cod-end). Table 18 shows the total catches length distributions by sex of Div. 3LNO, all catches length samples were with 280 mm mesh size and they were taken in Division 3N. These length distributions were applied to the catches made with 135 mm mesh size (192 tons). Most of the catches were in the 45-80 cm length range.

Div. 3M: Skate catches in Div. 3M (120 tons) were much smaller than those in Div. 3NO and they were by-catch of the Greenland halibut, redfish and cod fisheries. There is not available catches length distributions for this species in Division 3M.

Roughhead grenadier

Subarea 2 and 3: Roughhead grenadier is the main species taken as by-catch in the Greenland halibut fishery. Most of the 2011 catches and most of the length distribution samples were taken in Div. 3LM. Individuals were measured from tip of snout to base of first anal-fin ray (AFL) to the half centimetre below. Spanish catches in 2011 were 499 tons. Table 19 shows the AFL length distributions, grouping in 1 cm intervals, of Spanish catches for Div. 3LMNO. Most of the catches were in the 10-25 AFL length range, with a clear mode in 16 cm and a clear length difference between sexes, males are smaller than females.

Age distributions based on the Spanish commercial and Flemish Cap survey combined Age Length Key (ALK), mean weight and mean length (AFL) at age of the total catch for Div. 3LMNO are presented in Table 20. Most of the Roughhead grenadier catches in 2011 were based on ages 5 to 15 with a clear mode in 8 years old. This age distribution is similar to the years before.

White hake

Div. 3LMNO: Catches in the last year are in the same level as before 2000. Catches of this species in 2011 (91 tons) were a small by-catch of different fisheries. Catches in Div. 3LMN (24 tons) are by-catch of the Greenland halibut fishery and in Div. 3O (68 tons) are by-catch of the redfish fishery. There were not length distribution samples available for this species in 2011.

(B) Research studies

The Spanish bottom trawl survey in NAFO Regulatory Area Div. 3NO was conducted from 5th to 24th of June 2011 on board the R/V *Vizconde de Eza*. The gear was a *Campelen* otter trawl with 20 mm mesh size in the cod-end. A total of 122 valid hauls and 121 hydrographic stations were taken within a depth range of 44-1450 m according to a stratified random design. Furthermore, a stratified sampling by length class and sex was used to sample gonads and otoliths of Atlantic cod, American plaice and Greenland halibut for histological maturity, fecundity and growth studies. The results of this survey, including biomass indices with their errors and length distributions, as well as the calculated biomass based on conversion of length frequencies for Greenland halibut, American plaice, Atlantic cod, yellowtail flounder, redfish, witch flounder, roughhead grenadier, thorny skate and white hake are presented as Scientific Council Research Documents. In addition, age distributions are presented for Greenland halibut, American plaice and Atlantic cod.

In 2003 it was decided to extend the Spanish 3NO survey toward Div. 3L (Flemish Pass). In 2011, the bottom trawl survey in Flemish Pass (Div. 3L) was carried out on board R/V *Vizconde de Eza* using the usual survey gear (*Campelen* 1800) from 10th to 24th of August. The area surveyed was Flemish Pass to depths up 800 fathoms (1463 m) following the same procedure as in previous years. The number of hauls was 90 of which 89 were valid hauls. Survey results, including abundance indices and length distributions of the main commercial species, are presented as Scientific Council Research documents. Survey results for Div. 3LNO of the northern shrimp (*Pandalus borealis*) were presented in SCR 11/61. Samples for histological (Greenland halibut, American plaice, roughhead grenadier) and aging (Greenland halibut, American plaice, roughhead grenadier and cod) studies were taken. Feeding studies on demersal species (*Synaphobrachus kaupi*, *Notacanthus chemnitzii*, *Hydrolagus affinis* and *Harriotta raleighana*) were performed and 307 stomach contents were analysed in depths of 342 to 1419 m. Eighty-four hydrographic profile samplings were made in a depth range of 115-1445 m.

The EU bottom trawl survey in Flemish Cap (Div. 3M) was carried out on board R/V *Vizconde de Eza* using the usual survey gear (*Lofoten*) from June 27th to August 9th 2011. The area surveyed was Flemish Cap Bank to depths up to 800 fathoms (1460 m) following the same procedure as in previous years. The number of hauls was 126 and five of them were nulls. This year only 30 of 32 strata were adequately sampled. Survey results including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice, roughhead grenadier and Greenland halibut are presented as Scientific Council Research documents. Flemish Cap survey results for northern shrimp (*Pandalus borealis*) were presented in SCR 11/61. Samples for histological assessment of sexual maturity of cod, redfish, Greenland halibut and roughhead grenadier were taken. Oceanography studies continued to take place.

NEREIDA Project: During 2011 work with the taxonomic identification of the samples collected during NEREIDA 2009 and 2010 surveys was continued. Here is a summary of the main activities carried out during 2011 into the NEREIDA project:

Box Corer Samples: Overall 40 BC samples from a total of 368 have been processed to date. The Sackville Spur closed area was selected as the first case study from which Box Corer samples should be processed. The principal aim of this research was to acquire evidence to either support or oppose to continue the closure of the Sackville Spur to bottom-contact fishing gear. Analyses were centred upon the infauna extracted from Box Core samples inside and

outside the Sackville Spur closed area. Barrio *et al.* (2012) have described the results from this study. In addition, a similar assessment to the one carried out in Sackville Spur area is being carried out within North Flemish Pass (closed area 2). 25 BC samples have been processed.

Rock Dredge Samples: All 94 Rock Dredge samples have been processed by faunal group. Identification of Echinoderm and Cnidarian (except sea anemones) taxa to the lowest possible level has been completed. Molluscs and Porifera continue to be processed along with other less abundant taxonomic groups. It is expected to finish the processing of all groups before the end of 2014. At present over 1000 sponges spicule slides have been prepared for the specimen identification. A record of sponge and spicule photographs of sampled specimens during NEREIDA surveys is being prepared. In addition, Sponge Identification Sheets are being finalised in PDF format. Two reference collections with invertebrate ‘voucher’ specimens have also been created; one is stored in Vigo (Spain) and the other in Halifax (Canada). A common database is intended to store all the information regarding the invertebrate specimens collected during all the NEREIDA surveys. Biomass records from all 94 successful Rock Dredge trawls are being processed in an attempt to investigate the distribution of epibenthic biomass across the survey area, and how this relates to major geomorphologic features and environmental conditions.

Geology: Geologists working in the NEREIDA project have carried out a classification of the geological features of the surveyed area. A classification has been proposed and mapped, which is intended to provide a summary of the geological context for interpreting the biological data derived from box core and rock dredge samples. The classification is based primarily on the interpretation of multibeam bathymetric data and TOPAS sub-bottom profiler data. Locally, backscatter data was also used. Many of the meso-topographic features may have a local influence on neared circulation patterns and variations in sediment type.

More information about the progress of NEREIDA project can be consulted in the report of the 4th Meeting of the NAFO Scientific Council Working Group on Ecosystem Approaches to Fisheries Management (WGEAFM).

SUBAREA 6

A. Status of the fisheries

One Spanish trawler operated in NAFO Regulatory Area, Div. 6G using a midwater trawl gear, during 2011, amounting to 9 days (68 hours) of fishing effort. The most important species in catches was the *Beryx splendens*. There is not available biological information of these catches. Other species present in catches were *Aphanopus carbo* and *Epigonous telescopus* (Table 1).
