***SCIENTIFIC COUNCIL MEETING – JUNE 2014***

**PORtUGUESE RESEARCH REPORT FOR 2013**

by

J. Vargas, R. Alpoim, E. Santos and A. M. Ávila de Melo

INSTITUTO PORTUGUÊS DO MAR E DA ATMOSFERA – IPMA, I.P.  
Av. BRASÍLIA 1449-006, LISBOA, PORTUGAL

**A. Status of the fisheries**

In 2013, the Portuguese provisional nominal catches proceeding from NAFO Regulatory Sub Area 3 reached 17 794 ton (Table 1-A). Nominal catches increased continuously from 2000 to 2003, when they peaked at 21 300 ton, but declined sharply afterwards (Table I-B); during 2004- 2008 catches stabilized between 11 500 and 13 000 ton. Over recent years (2009-2013) catches increased from around 15 400 ton (2009-2010) to near 16 300 ton (2011-2012) and reached, in 2013, the highest value since 2003.

The 2013 fishing effort is provisional, in previous years the fishing effort, after the SC June meeting, has been revised downwards. Based on provisional effort data, in 2013 the fishing effort in days reached the highest value since 2003 (1900 days fishing), due a duplication of fishing effort in the traditional grounds (Divisions 3L and 3M). The fishing effort in the divisions 3N and 3O remains at the same level of the past year. In 2013, 10 trawlers composed the Portuguese fleet that operated in the NAFO area.

Due to the reopening, in 2010, of the fishery for cod in Div 3M (Flemish Cap), this species represents now about 50% of the total catch in this division and 25% of the Portuguese catches in all Sub Area 3. Catches of redfish remained more or less stable in Div. 3L and 3N; but, by second consecutive year, fell in div. 3M (18%) and, because of that, the total catches of this specie decreased around 3000 ton from 2011 to 2013, representing now 40% of the total catches in this division. In Div. 3O, the catches of redfish increased about 1000 ton from 2012 to 2013, reached now around 90% of the catches in this division and 26% of the Portuguese catches in all Sub Area 3. Redfish remains by far the most important species in the Portuguese commercial catches from Sub Area 3, representing in recent years more than 50% of the overall catch.

A strong decrease was observed for the roughhead grenadier catch in Div. 3L and 3M: in both divisions, after two consecutive years when the catches doubled, the 2013 catches decreased around 80% of his value and return to the level observed in 2010. The shrimp fishery in Div. 3L, that in 2009 its catches reached 20% of the total catch in this division, declined significantly in 2010 and was reduced to values around zero in 2011-2013.

The Greenland halibut catches increased around 20% from 2012 to 2013, returning to the level of 2009-2011. Greenland halibut together with redfish continues to be the bulk of the catch on Div. 3L (around 85% of the overall catch since 2009). The yellowtail flounder catches decreased around 400 ton (-80%) in divisions 3N and 3O combined; skates catches doubled in division 3N and remains more or less stable in all others divisions; and the catch of white hake reached 80 ton in 2013 against 18 ton in 2012. The catches of other species remained more or less stable in all divisions.

The catch in Div. 3M (mainly cod and redfish) continue in 2013, like the most recent years, to represent around 50% of the total catch. This division is, at present, the most important ground for the Portuguese NAFO fishery, but cod replaced redfish as the most important fishery. On division 3O, redfish continues the most important fishery, with almost 90% of the catches and this division represents now around 30% of the year catch. In Div. 3N, after a

decrease of 30% during 2012, the catches of redfish remains stable and the redfish fishery is the most important one (38% of the total catch in 2013), follow by skates fishery, that doubled its catch and represents 25% of the catches in division 3N.

## **B. Portuguese Annual Sampling Program**

### **1. Catch and effort sampling.**

Effort and CPUE data for 2013 Portuguese trawl fishery on the NAFO Regulatory Area were obtained through the revision of skipper logbooks from two trawlers, kindly supplied by its owners. All the information (round weight of the catch by species, fishing effort, positions and depths) has been recorded on a tow-by-tow basis. The vessel conversion factors were used to convert its processed landings in catches. Effort data in days and hours were supplied by the Portuguese administration (since 2009 due to changes in its database), but the values for 2013 are provisional and available only for the fishing effort in days (not yet in hours). The update for the past years was extracted from Database STATLANT 21B, on May 30, 2014 (Table II-A/B).

The daily catch and effort data from the logbook were used to estimate the directed effort and CPUE for each of the target species/stock, as well as the main by-catch species and depth range of the different fisheries, on a monthly basis. From the data available, the majority of the fishing effort was directed towards cod, redfish and Greenland halibut. Data regarding directed effort and catch rates of the Greenland halibut fishery are presented in Table III to IV-B and Fig. 1.

The Greenland halibut CPUE series was updated with the 2013 observed CPUEs. The additive model (Ávila de Melo and Alpoim, 1995), was upgraded in 1998 (Alpoim *et al.*, 1998) and used, like in previous years, to standardize the observed CPUEs, but excluding the vessel factor because the sampling program in recent years was carried out on vessels that were not sampled before. If the vessel factor is applied, these new vessels will increase a lot the noised. Because they are the only vessels sampled in the recent years, we assumed that all vessels belong to the same category what is realistic. From January 1988 till April 1995 each monthly observed CPUE of this series was previously corrected for 130mm mesh size (Ávila de Melo and Alpoim, 1996). In this analysis, any observation corresponding to a month and a trawler with less than 10 hours of directed effort was rejected. The CPUEs are presented in Tables IV and Fig. 1, with the associated standard errors (+/- 2 standard errors in the Figures) and coefficients of variation.

#### **1.1. Comments on catch and effort data (based on the vessels sampled)**

##### **1.1.1. Greenland halibut in Div. 3L, 3M, 3N and 3O**

In Div. 3L catch rates declined prior to the boom of the deep-water fishery (Table IV-A, Fig. 1). However, it is from 1990 to 1991, i.e. from the first to the second year of this new fishery in the Regulatory Area, that CPUEs fell by half. Between 1991 and 1994 catch rates remained stable at a low level. Since then, catch rates gradually increased, reaching an upper level in 1999-2000. Catch rates declined in 2001 and remained stable at that lower level in 2002 and 2003. In 2004 the catch rates decline again, reaching the lowest value since 1994. However, after 2004 the Greenland halibut catch rates recovered continuously and, despite the high variability from 2006 to 2013, the catch rates reached, in this period, the highest values observed of the time series.

Div. 3M catch rates despite more noisy follows the same trend as the ones in Div. 3L.

For all Div. 3LMNO combined (Table IV-A, Fig. 1) the observed catch rates series follows the Div. 3L pattern, since this is the division of Sub Area 3 with the highest concentration of Greenland halibut fishing effort.

## **2. Biological Sampling**

In 2013, biological sampling was obtained from two stern trawlers fishing in Div. 3L, 3M, 3N and 3O during all the year. Apart from species under moratoria, a priority to be sampled whenever they appear in the hauls, biological sampling was conducted for the two most abundant species in each haul, following the NAFO sampling recommendations.

Cod, redfish (*S. mentella*), Greenland halibut, American plaice and thorny skate were sampled in Div. 3L, 3M, 3N and 3O (Tab. V). Redfish (*S. marinus*) was sampled in Div. 3M. Roughhead grenadier was sampled in Div. 3L and 3M. Witch flounder was sampled in Div. 3N and 3O. Yellowtail flounder was sampled only in Div. 3N and white hake only in Div. 3O.

Since 1996, all commercial information is representative of the catch as a whole, although sampling continues to be carried out by sex, with the exception of cod, white hake, Atlantic halibut and haddock. Mean weight and mean weight in the catch are derived from the length-weight relationships calculated from the commercial sampling in 2013 and are presented in Table VI.

## **2.1. Catch and by-catch composition of the 2013 trawl fishery (130mm codend mesh size).**

The regular mesh size in the codend used by the monitored trawlers fishing groundfish was the 130mm and, when the mesh size is not mentioned it, means that the sample refers to the 130mm mesh size. Nevertheless, some sets in Div. 3N were made with a skate trawl net with 200mm/280mm mesh size in the codend, representing 32% in Div. 3N of the total effort sampled (lengths only). The size of these catches within the overall sampled catch in Div. 3N is about 13% for cod, 40% for witch flounder, 54% for American plaice, 77% for yellowtail flounder and 65% for thorny skate.

### **2.1.1. Cod Div. 3L**

Information on length composition of the cod by-catch in Div. 3L is available for Mars and April and from July to November (Table VII, Fig. 2), from 257 m to 464 m depth.

Lengths between 33 cm and 42 cm dominated the catch, with a modal class at 33 cm (mean length and weight of 41 cm and 677 g).

### **2.1.2. Cod Div. 3M**

Information on length composition of the cod trawl catch in Div. 3M is available from February to November, except for August (Table VIII, Fig. 3), from 179 m to 500 m depth.

Lengths between 39 cm and 48 cm dominated the catch, with a small peak at 42 cm (mean length and weight of 47.8 cm and 1200 g).

The Div. 3M cod age-length keys for the 1st and 2nd Trimesters and year are presented in Table VIII-B - D.

The 2006 to 2008 year classes, 3 to 5 years old in 2013, dominated the trawl catches, being the 2007 year class the most represented (Tab. VIII-E, Fig. 3b).

### **2.1.3. Cod Div. 3N**

Information on length composition of the cod by-catch in Div. 3N is available from February to April, for June and from September to November (Table IXa, Fig. 4a), from 83 m to 739 m depth.

Lengths between 36 cm and 42 cm dominated the catch, with a very modal class at 39 cm (mean length and weight of 42.8 cm and 750 g).

### **2.1.4. Cod Div. 3N 280 mm mesh size**

Information on length composition of the cod by-catch in Div. 3N (280 mm mesh size) is available for June, November and December (Table IXb, Fig. 4b), from 50 m to 102 m depth.

Lengths between 39 cm and 51 cm dominated the catch, with a very modal class at 39 cm (mean length and weight of 45.6 cm and 924 g).

### **2.1.5. Cod Div. 3O**

Information on length composition of the cod by-catch in Div. 3O is available from February to November, except for July and August (Table X, Fig. 5), from 93 m to 650 m depth.

Lengths between 36 cm and 42 cm dominated the catch, with a very clear modal class at 39 cm (mean length and weight of 41.8 cm and 695 g).

### **2.1.6. Redfish (*S. mentella*) Div. 3L**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3L is available from March to November (Table XI, Fig. 6), from 227 m to 958 m depth.

Lengths between 21 cm and 23 cm dominated the catch, with a modal class at 22 cm (mean length and weight of 24.5 cm and 215 g).

### **2.1.7. Redfish (*S. mentella*) Div. 3M**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3M is available from February to November, except for August (Table XII, Fig. 7), from 190 m to 576 m depth.

Lengths between 21 cm and 23 cm dominated the catch, with a modal class at 22 cm (mean length and weight of 25.5 cm and 251 g).

### **2.1.8. Redfish (*S. mentella*) Div. 3N**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3N is available from February to November, except for July and August (Table XIII, Fig. 8), from 67 m to 586 m depth.

Lengths between 19 cm and 22 cm dominated the catch, with a very clear modal class at 22 cm (mean length and weight of 21.8 cm and 155 g).

### **2.1.9. Redfish (*S. mentella*) Div. 3O**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3O is available from February to November, except for July and August (Table XIV, Fig. 9), from 93 m to 515 m depth.

Lengths between 19 cm and 22 cm dominated the catches, with a two clear modal classes at 20 cm and 21 cm (mean length and weight of 21.2 cm and 142 g).

### **2.1.10. Redfish (*S. marinus*) Div. 3M**

Information on length composition of the redfish (*S. marinus*) trawl catches in Div. 3M is available from March to July and for November (Table XV, Fig. 10), from 190 m to 510 m depth.

Lengths at 22 cm, between 25 cm and 28 cm and at 31cm dominated the catches, with a clear modal class at 28 (mean length and weight of 27.7 cm and 310 g).

### **2.1.11. American plaice Div. 3L**

Information on length composition of the American plaice by-catch in Div. 3L is available for March and from July to November (Table XVI, Fig. 11), from 233 m to 958 m depth.

Lengths between 28 and 34 cm dominated the catch, with no modal classes (mean length and weight of 32.6 cm and 320 g).

### **2.1.12. American plaice Div. 3M**

Information on length composition of the American plaice by-catch in Div. 3M is available for March and from June to November, except for August (Table XVII, Fig. 12), from 194 m to 490 m depth.

Lengths between 26 and 38 cm dominated the catch, with a very clear modal class at 32 cm (mean length and weight of 34.1 cm and 389 g).

### **2.1.13. American plaice Div. 3N**

Information on length composition of the American plaice by-catch in Div. 3N is available from February to April and from September to November (Table XVIIIa, Fig. 13a), from 83 m to 550 m depth.

Lengths between 26 and 34 cm dominated the catch, with a modal class at 32 cm (mean length and weight of 32.9 cm and 326 g).

### **2.1.14. American plaice Div. 3N 280 mm mesh size**

Information on length composition of the American plaice by-catch in Div. 3N (280 mm mesh size) is available for June, November and December (Table XVIIIb, Fig. 13b), from 50 m to 102 m depth.

Lengths between 32 and 38 cm dominated the catch, with a modal class at 34 cm (mean length and weight of 37.2 cm and 482 g).

### **2.1.15. American plaice Div. 3O**

Information on length composition of the American plaice by-catch in Div. 3O is available from February to May and from September to November (Table XIX, Fig. 14), from 93 m to 650 m depth.

Lengths between 28 and 34 cm dominated the catch, with a modal class at 32 cm (mean length and weight of 33 cm and 339 g).

### **2.1.16. Yellowtail flounder Div. 3N**

Information on length composition of the yellowtail flounder by-catch in Div. 3N is available for September and October (Table XXa, Fig. 15a), from 96 m to 128 m depth.

Lengths between 30 and 36 cm dominated the catch, with a modal class at 30 cm (mean length and weight of 33.9 cm and 360 g).

### **2.1.17. Yellowtail flounder Div. 3N 280 mm mesh size**

Information on length composition of the yellowtail flounder catch in Div. 3N (280 mm mesh size) is available for June and November (Table XXb, Fig. 15b), from 40 m to 53 m depth.

Lengths at 30 cm, 34 cm and 36 cm dominated the catch, with a modal class at 30 cm (mean length and weight of 34.2 cm and 387 g).

### **2.1.18. Greenland halibut Div. 3L**

Information on length composition of the Greenland halibut catches in Div. 3L is available from March to July and for October and November (Table XXI, Fig. 16), from 806 m to 1404 m depth.

Lengths between 38 cm and 44 cm dominated the catch, with a modal class at 40 cm (mean length and weight of 43 cm and 771 g).

### **2.1.19. Greenland halibut Div. 3M**

Information on length composition of the Greenland halibut catches in Div. 3M is available for March and from May to July (Table XXII, Fig. 17), from 685 m to 1200 m depth.

Lengths between 40 cm and 46 cm dominated the catch, with a very clear modal class at 44 cm (mean length and weight of 43.8 cm and 795 g).

### **2.1.20. Greenland halibut Div. 3N**

Information on length composition of the Greenland halibut catches in Div. 3N is available from March to June (Table XXIII, Fig. 18), from 380 m to 1251 m depth.

Lengths between 40 cm and 46 cm dominated the catch, with a modal class at 46 cm (mean length and weight of 45.7 cm and 911 g).

### **2.1.21. Greenland halibut Div. 3O**

Information on length composition of the Greenland halibut catches in Div. 3O is available only for June (Table XXIV, Fig. 19), from 500 m to 662 m depth.

Despite the small sampling (1 sample, 50 fish measured), the data shows that the lengths at 40 cm dominated the catch (mean length and weight of 44.4 cm and 829 g).

### **2.1.22. Roughhead grenadier Div. 3L**

Information on length composition of the roughhead grenadier catches in Div. 3L is available from March to November, except for August and September (Table XXV, Fig. 20), from 806 m to 1404 m depth.

Anal fin lengths between 11 cm and 13 cm dominated the catch, with a very clear modal class at 12 cm (mean length and weight of 13.1 cm and 233 g).

### **2.1.23. Roughhead grenadier Div. 3M**

Information on length composition of the roughhead grenadier catch in Div. 3M is available for April and May (Table XXVI, Fig. 21), from 946 m to 1165 m depth.

Despite the small sampling (2 sample, 177 fish measured), the data shows that the anal fin lengths between 16 cm and 19 cm dominated the catch (mean length and weight of 18.2 cm and 565 g).

### **2.1.24. Witch flounder Div. 3N**

Information on length composition of the witch flounder by-catch in Div. 3N is available from March to June (Table XXVIIa, Fig. 22a), from 460 m to 1251 m depth.

Lengths at 36 cm, 40 cm and 42 cm dominated the catch (mean length and weight of 35.1 cm and 297 g).

### **2.1.25. Witch flounder Div. 3N 280 mm mesh size**

Information on length composition of the witch flounder by-catch in Div. 3N (280 mm mesh size) is available only for November (Table XXVIIb, Fig. 22b), from 53 m to 79 m depth.

Lengths between 30 cm and 38 cm dominated the catch (mean length and weight of 34.9 cm and 251 g).

### **2.1.26. Witch flounder Div. 3O**

Information on length composition of the witch flounder by-catch in Div. 3O is available from February to April and from September to November (Table XXVIII, Fig. 23), from 109 m to 594 m depth.

Lengths between 28 cm and 36 cm dominated the catch, with a modal class at 32 cm (mean length and weight of 34.6 cm and 255 g).

### **2.1.27. Thorny skate Div. 3L**

Information on length composition of the thorny skate catches in Div. 3L is available for October and November (Table XXIX, Fig. 24), from 260 m to 320 m depth.

Because the small sampling (2 samples, 80 fish measured) we not take any conclusion about the dominated lengths in the catch (mean length and weight of 55.6 cm and 2313 g).

### **2.1.28. Thorny skate Div. 3M**

Information on length composition of the thorny skate catches in Div. 3M is available from March to July, except for April (Table XXX, Fig. 25), from 275 m to 1043 m depth.

The data shows that the lengths at 48 cm and 55 cm dominated the catch (mean length and weight of 59.7 cm and 2578 g)

### **2.1.29. Thorny skate Div. 3N**

Information on length composition of the thorny skate catches in Div. 3N is available for March and April (Table XXXIa, Fig. 26a), from 387 m to 966 m depth.

Because the small sampling (2 samples, 103 fish measured) we not take any conclusion about the dominated lengths in the catch, but we can identify a modal class at 49 cm (mean length and weight of 54.4 cm and 2073 g).

### **2.1.30. Thorny skate Div. 3N 280 mm mesh size**

Information on length composition of the thorny skate catches in Div. 3N (280 mm mesh size) is available for June and November (Table XXXIb, Fig. 26b), from 40 m to 53 m depth.

Despite the small sampling (2 samples, 133 fish measured), data shows that the lengths at 49 cm and 50 cm dominated the catches (mean length and weight of 55.3 cm and 2213 g).

### **2.1.31. Thorny skate Div. 3O**

Information on length composition of the thorny skate catches in Div. 3O is available for March, May, September and October (Table XXXII, Fig. 27), from 97 m to 455 m depth.

Lengths at 55 cm dominated the catch (mean length and weight of 54.3 cm and 1989 g).

### **2.1.32. White hake Div. 3O**

Information on length composition of the white hake catches in Div. 3O is available from February to June, except for May and from September to November (Table XXXIII, Fig. 28), from 109 m to 515 m depth.

Despite the large range of lengths, the data show that lengths between 42 cm and 46 cm, dominated the catch (mean length and weight of 44 cm and 763 g).
