Abstract

A stratified random bottom trawl survey on Flemish Cap was carried out from June 25th to July 23th 2014. The area surveyed was extended up to depths of 800 fathoms (1460 meters) following the same procedures as in previous years and 181 fishing stations planned. The survey was carried out by the R/V *Vizconde de Eza* with the usual survey gear (*Lofoten*). A total of 181 valid hauls were made by the vessel R/V *Vizconde de Eza*, 118 up to 730 meters depth and 56 up to 1460 meters. Survey results including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice, Greenland halibut, roughhead grenadier and shrimp are presented. The general indexes for this year are estimated taken into account the traditional swept area (strata 1-19, up to depths of 730 m.) and the total area surveyed (strata 1-34, up to depths of 1460 m.).

Introduction

The survey on Flemish Cap was carried out on board R/V *Vizconde de Eza* in 2014. A total of 181 valid bottom trawls were made up to a depth of 1460 m (800 fathoms) (Fig. 1). The survey covered all strata of the bank adequately with the exception of the strata corresponding with the Beothuk knoll (35-39 strata) in the southwest of the bank and the strata 26 and 27 in the southeast. A synoptic sheet of the survey with vessel and gear characteristics is shown in Table 1. This was the 27th survey of the series initiated by the EU in 1988. All surveys had a stratified random design following NAFO specifications (Doubleday, 1981). Dates, vessel, number of valid tows (including the number of valid tows until 700 m in brackets since 2002) and dates of all the surveys were:

Year	Vessel	Valid tows	Dates	Year	Vessel	Valid tows	Dates
1988	Cornide de Saavedra	115	8/7 - 22/7	2002	Cornide de Saavedra	120	30/6 - 17/7
1989	Cryos	116	12/7 - 1/8	2003	Vizconde de Eza	177 (114)	2/6 - 2/7
1990	Ignat Pavlyuchenkov	113	18/7 - 6/8	2004	Cornide de Saavedra	50**	7/6 - 17/6
1991	Cornide de Saavedra	117	24/6 - 11/7	2005	Vizconde de Eza	177 (124)	25/6 - 2/8
1992	Cornide de Saavedra	117	29/6 - 18/7	2006	Cornide de Saavedra	61**	23/7 - 2/8
1993	Cornide de Saavedra	101	23/6 - 8/7	2007	Vizconde de Eza	176 (117)	1/7 - 21/8
1994	Cornide de Saavedra	116	6/7 - 23/7	2008	Vizconde de Eza	179 (115)	1/7-26/7
1995	Cornide de Saavedra	121	2/7 - 19/7	2009	Vizconde de Eza	174 (117)	23/6-19/7
1996	Cornide de Saavedra	117	28/6 - 14/7	2010	Vizconde de Eza	178 (119)	23/6-20/7
1997	Cornide de Saavedra	117	16/7 - 1/8	2011	Vizconde de Eza	153 (97)	22/6-21/7
1998	Cornide de Saavedra	119	17/7 - 2/8	2012	Vizconde de Eza	128 (79)	29/6-9/8
1999	Cornide de Saavedra	117	2/7 - 20/7	2013	Vizconde de Eza	174(118)	26/6-24/7
2000	Cornide de Saavedra	120	10/7 - 28/7	2014	Vizconde de Eza	181(120)	26/6-23/7
2001	Cornide de Saavedra	120	3/7 - 20/7				25/6-23/7

() valid tows carried out in depths lesser than 400 fathoms

** calibration tows

Material and Methods

As the last year, the R/V *Vizconde de Eza* carried out the survey following the same procedures as in previous years, the same bottom trawl net *Lofoten*, with a cod-end mesh size of 35 mm, as well as all other details of its use (Saborido-Rey and Vazquez, 2003).

Results

Biomasses of main species in past surveys estimated by swept area method (tons) are:

Survey	Cod	American plaice	Redfish	Greenland halibut	Roughhead grenadier	Shrimp
120-730 m	1988	40839	16046	188331	6926	2009

	2014	159939	3800	179956	29288	4111

Values for surveys before 2003, when R/V *Cornide de Saavedra* was used, are transformed to their equivalences for R/V *Vizconde de Eza* following the accepted calibration among the two vessels (González Troncoso and Casas, 2005). From 2004 onwards, abundances are calculated for 19 shallowest strata covering the bank up to 730 m deep, as it was done in previous years, and for 32 strata up to 1460 m deep.

These survey indices are also presented in Table 2, and even they belong to different species and pelagic vs. demersal character and the transformation to the new scale (since 2003 the R/V *Cornide de Saavedra* was substituted by the R/V *Vizconde de Eza*) only was carried out for the main species, a global index is presented

for each year, which minimum occurred in 2001. The composition of the species in 2014 is similar to that found in the beginning of the series: cod at high levels, shrimp residual, redfish fluctuating around 200-300 kt. and Greenland halibut and grenadiers at low levels. Everything seems to point to a return to the situation found at the beginning of the EU survey series, and prior to the changes induced by the collapse of cod in the late 90. Only American plaice with low values of biomass does not show clear signs of recovery.

Cod

Mean catch per towed mile and biomass by strata with standard errors are presented in Table 3. These indices are compared with results of previous surveys in Table 5. Total biomass calculated by the swept area method and compared with Russian survey results are:

Year	EU (1)	Russia: (2)	(3)	Year	EU (1)	Russia: (2)	(3)
1983		23,070		1999	2,854	-	-
1984		31,210		2000	3,062	-	-
1985		28,070		2001	2,695	784	-

1996	9,013	730	-	2012	113,227		
1997	9,966	-	-	2013	72,289		
1998	4,986	-	-	2014	159,939		tons

1) Biomass estimated from bottom trawl survey. 2) Biomass estimated from bottom trawl survey (Kiseleva and Vaskov 1994; Kiseleva 1996, 1997; Vaskov and Igashov, 2003). 3) Biomass estimated of bottom trawlable plus pelagic biomass (Borovkov *et al.* 1993; Kiseleva and Vaskov 1994).

Tables 4, 6 and 7 show the length distribution, the age-length key and the abundance at age by stratum respectively. Distribution of survey catches is presented in Figure 2. Evolution of biomass and abundance are illustrated in Figure 3. The abundance at age along the series is also shown in Table 8.

The 1992 to 2003 year-classes failed almost completely. The abundances of 2004-2008 year classes are higher than in previous 12 years. The abundance of the 2010 year-class was the highest of those in previous recent years, and the 2009 and 2011 ones were also high. The 2012 and 2013 year-classes seem to have failed according to current results at age 1 (Figure 4).

The 2014 biomass is the highest of all the series, but not the abundance that is in the level of the 2010 one, which indicates an increase in older ages and a fail in recruitment.

American plaice

Mean catch per towed mile and biomass by strata with standard errors are presented in Table 9. Survey biomass, as calculated by the swept area method, is compared with results of previous surveys in Table 11. This biomass is compared with Russian survey results in the following table:

Year	EU	Russia (1)	Year	EU	Russia (1)	Year	EU	Russia (1)
1983		8,900	1994		8,227	2005		2,760
1984		7,500	1995		6,785	2006		1,691
1985		7,800	1996		4,098	2007		1,053
1986		20,200	1997		3,026	2008		1,766
1987		9,300	1998		3,437	2009		1,442
1988	16,046	6,500	1999		2,585	2010		2,446
1989	14,047	5,000	2000		1,606	2011		4,084
1990	11,983	1,200	2001		2,404	2012		4,491
1991	10,087	14,400	2002		2,049	2013		3,698
1992	8,656	1,200	2003		2,286	2014		3,800
1993	7,861	2,700 ton	2004		3,525			ton

1) Rikhter *et al.* 1991; Borovkov *et al.* 1992, 1993, 1994; Vaskov and Igashov, 2003.

Tables 10, 12 and 13 show the length distribution, the age-length key and the abundances at age by stratum respectively. Figure 5 shows the distribution of the survey catches in 2014. The abundance at age along the series is shown in Table 14. Also, the evolution of survey biomass and abundance along the series is presented in Figure 6.

Fish aged 6 or more roughly correspond with fishable biomass. Results indicate two periods for recruitment, and a change from an upper abundance level to a lower one. The 1991 year-class was the first weak cohort. The 2006 year-class is the more abundant since 1991, but its abundance is only intermediate. Recruitment for later year-classes seems to be weaker; too weak for a quick recovery of the stock. Figure 7 shows the age distribution over the years. It illustrates the lack of recruitment that occurred for many years, and how most recent year-classes are weaker than those at the beginning of the series.

Redfish

All redfish catches were classified by species. The group name *juvenile* contains those individuals of small size for which routine classification was not possible. The 15 cm maximum length is a good reference for this group, but it was never used as a criterion. The skill required to identify the species increased over time, so the group *juvenile* is not a uniform defined group, but it is maintained for practical reasons.

Mean catch per standard towed mile and biomass by strata with the standard errors are presented in Tables 15, 19, 23 and 27 for *Sebastes marinus*, *S. mentella*, *S. fasciatus* and the *juvenile* group respectively. The following table shows the total biomass (tons) by year in the traditional strata (<730 m.).

Year	<i>Sebastes</i>	<i>Sebastes spp.</i>			Total
	<i>marinus</i>	<i>mentella</i>	<i>fasciatus</i>	<i>juvenile</i>	
1988	18,229		170,102		188,331
1989	27,312		135,223		162,535
1990	16,751	86,695		23,311	126,757
1991	4,864	59,552	6,755	5,784	76,955
1992	4,909	85,408	6,314	33,578	130,209
1993	4,789	21,235	5,175	41,409	72,608
1994	39,516	42,495	9,303	71,211	162,525
1995	10,754	70,567	5,986	337	87,644
1996	13,431	92,647	13,112	472	119,662
1997	77,125	66,710	20,780	1,201	165,816
1998	7,640	53,946	7,656	1,590	70,832
1999	11,215	77,610	9,460	366	98,651
2000	53,388	106,283	15,364	2,955	177,990
2001	10,244	45,931	13,715	7,455	77,345

2003	40,110	28,785	15,031	9,890	93,816
2004	85,383	45,999	76,164	43,059	250,605
2005	147,688	105,110	123,326	75,762	451,215
2006	298,290	105,849	319,387	43,396	766,922
2007	88,071	51,191	261,790	63,576	464,628
2008	240,777	42,570	202,288	80,491	566,126
2009	72,211	111,787	171,676	2,804	358,479
2010	47,377	62,684	97,067	5,083	212,211
2011	29,056	103,678	59,753	4,543	197,030
2012	55,410	166,693	82,539	1,304	305,946
2013	32,016	102,500	84,801	420	219,737
2014	37,171	96,158	46,174	422	179,925

Tables 16-18, 20-22, 24-26 show the age length key, length frequency and the abundance at age by stratum for the three species of redfish respectively. Catches per haul distributions and biomass of the three species and juveniles are presented in the Figure 8 and 9 respectively. Tables 27 and 28 show the mean catch per towed mile y biomass by stratum of the juveniles (redfish with length up to 15-17 cm).

Greenland halibut

Mean catch per towed mile and the estimated biomass by strata with their standard errors are presented in Table 29. These indices are compared with results of previous surveys in Table 30. The following table summarises the total biomass in tons by year in depths <730 m. (1988-2014 years) and in depths up to 1460 m. (2004-2014 years).

Year	EU < 730 m.	Year	EU < 730 m.	EU < 1460 m.
1988	6,926	2002	12,100	
1989	4,472	2003	6,214	
1990	5,799	2004	12,292	28,343
1991	8,169	2005	11,698	21,515
1992	8,728	2006	11,706	24,357
1993	6,529	2007	13,040	31,723
1994	8,037	2008	11,995	39,614
1995	10,875	2009	7,775	36,047
1996	11,594	2010	6,299	26,739
1997	16,098	2011	6,713	32,257
1998	24,229	2012	4,291	23,505
1999	21,207	2013	2,799	23,391
2000	16,959	2014	5,168	29,288
2001	13,872			

Age-length keys, length frequency and frequency at age by stratum are presented in Tables 31, 32 and 33 respectively. Catch per haul distribution is presented in Figure 10. Figure 11 shows the estimated biomass with their standard error and numbers by year. The abundance at age along the series is shown in Table 34. The figure 12 shows the age distribution by year in the EU Flemish Cap surveys.

Roughhead grenadier (*Macrourus berglax*)

Mean catch per standard towed mile and estimated biomass by strata with their standard errors are presented in Table 35. These indices are compared with results of previous surveys in Table 36. The following table summarises the total biomass in tons by year:

Biomass (tons) along this survey series were:

Year	EU < 730 m.	Year	EU < 730 m.	EU < 1460 m.
1988	2,009	2002	1,211	
1989	871	2003	2,348	
1990	852	2004	3,597	17,185
1991	1,335	2005	2,387	12,560
1992	1,577	2006	3,933	11,336
1993	3,021	2007	1,367	7,271
1994	1,975	2008	2,961	12,138
1995	1,558	2009	781	7,303
1996	1,362	2010	1,403	9,092
1997	1,197	2011	729	8,800
1998	1,691	2012	612	5,477
1999	1,250	2013	807	4,298
2000	1,047	2014	399	4,111
2001	2,079			

Age-length keys, length frequency and frequency at age by strata are presented in Tables 37, 38 and 39, respectively. Catch per haul distribution is presented in Figure 13. Figure 14 shows the estimated biomass with their standard error and numbers by year. The abundance at age along the series is shown in Table 40. Figure 15 shows the age distribution by year in the EU Flemish Cap surveys.

Shrimp

Casas J.M. (2014) presented detailed results.

Table 1 – Technical data of the 2014 survey.

Procedure	Specification
Vessel	R/V <i>Vizconde de Eza</i>
GT	1 400 t
Power	1 800 HP
Mean trawling speed	3.5 knots
Trawling time	30 minutes effective time
Fishing gear	type <i>Lofoten</i>
footrope / handrope	31.20 / 17.70 m
footgear	27 steel bobbins of 35 cm
vertical opening	3.0 m (MARPORT)
warps	100 meters, 45 mm, 200 Kg/100m
trawl doors	polyvalent, 850 Kg
wire length	2 × depth echo sounder (m.) + 250.
mesh size in cod-end	35 mm
Type of survey	Stratified sampling
Station selection procedure	Random
Criterion to change position of a selected tow	- Unsuitable bottom for trawling according to ecosounder register. - Information on gear damage from previous surveys.
Criterion to reject data from tow	- tears in cod-end - severe tears in the gear - less than 20 minutes tow - bad behaviour of the gear
Daily period for fishing	6.30 to 18:30 hours
Species for sampling	All fish, squid and shrimp
Species for age determination	Cod, American plaice, redfish (<i>Sebastes mentella</i>), Greenland halibut and Roughhead grenadier (<i>Macrourus berglax</i>).
