

**SCIENTIFIC COUNCIL MEETING – JUNE 2017****Spanish Research Report for 2016**

by

F. González-Costas<sup>1</sup>, G. Ramilo<sup>1</sup>, E. Román<sup>1</sup>, A. Gago<sup>1</sup>, M. Casas<sup>1</sup>, M. Sacau<sup>1</sup>, E. Guijarro<sup>1</sup> D. González-Troncoso<sup>1</sup>and. J. Lorenzo<sup>1</sup>

<sup>1</sup> Instituto Español de Oceanografía, Vigo, Spain

Spanish catch and effort information used in this Report is based on the logbook data contributed by the Spanish Administration. The logbooks information for 2016 was available haul by haul. In previous years was used in this report the NAFO Observers effort information because the logbook effort information was grouped by day and it was difficult to know the distribution of effort by depth or fishery. Table 1 presents the Spanish catches by species and Division in 2016. In 2016 total effort of the Spanish fleet in NAFO Regulatory Area was 1,073 days.

In 2016, IEO scientific observers were on board 326 fishing days that it means 29 % of the Spanish total effort. All length, age and biological information presented in this paper is based on sampling carried out by IEO scientific observers: 658 samples were taken in 2016, with 68,721 individuals of different species examined (Table 2).

**SUBAREA 3****A. Status of the fisheries**

A total of 11 Spanish trawlers operated in Div. 3LMNO NAFO Regulatory Area during 2016, amounting to 1,057 days (15,577 hours) of fishing effort. Table 3 presents the Spanish effort (fishing hours) since 2003 in NAFO Regulatory Area (NRA) Subarea 3. Total catches (Table 1) for all species combined in Div. 3LMNO were 12,950 tons in 2016.

Table 4 shows the effort (hours) by quarter, Division and their percentage by depth. Table 5 presents the percentage of the effort by Division, quarter and mesh size and Figure 1 shows the Spanish fleet footprint in 2016 based on the NAFO Observers information. Figure 1 show the directed hauls to each species. Directed hauls are when more than 50% of the total haul catches corresponds to that species.

These effort tables and figure show that the Spanish fleet carry out different directed fisheries in NAFO Subarea 3 characterized by different mesh size, target species, depth and fishing area. The Spanish fishery in NAFO Subarea 3 in 2015 has a similar pattern described by Gonzalez-Costas (2012): Spanish fleet had the following fisheries in NAFO Division 3LMNO: 1) In Divisions 3LMNO at more than 600 meters depth with demersal 130 mm mesh size gear with Greenland halibut as target species. 2) In Divisions 3LMNO, mainly in Div 30 and 3M with demersal 130 mm mesh size gear in the 200-600 strata. The target species is the redfish. 3) In Divisions 3NO with 280 mm mesh size at less than 200 meters depth. The target species is the skates. 4) In Divisions 3NO with demersal 130 mm mesh size in the 200-600 strata. The target species is the Witch flounder. 5) In Division 3M at depth between 150-550 meters targeting cod with 130 mm mesh size gear.

Effort and fisheries by Division were: in Div. 3L, most of the effort was performed at more than 600 meters depth using cod-end mesh size of 135 mm, indicating that the fleet targeted Greenland halibut. Regarding Div. 3M, the 70% of the effort was carried out using 135 mm cod-end mesh size at less than 600 m depth targeting redfish and cod and at depths more than 600 m (30%) targeting Greenland halibut. In Div. 3N, the effort carried out using 280 mm was the 66% and with 135 mm cod-end mesh size was 34%, which indicates that the fleet targeted mainly skate in depth less than 200 m. and Greenland halibut in depth more than 600 m. Fishing effort in Div. 3O was limited (15%) targeting skates using mainly 280 mm mesh size (38%) in depth less than 200 meters and redfish in depth between 200-600 meters using 135 mm mesh size (44%).

In addition to NAFO observers (NAFO Observers Program), 8 IEO scientific observers were onboard Spanish vessels, comprising a total of 302 observed fishing days, around 29% coverage of the total Spanish effort. Besides recording catches, discards and effort, these observers carried out biological sampling of the main species taken in the catch. For Greenland halibut, roughhead grenadier, American plaice and cod this includes recording weight at length, sex-ratio, maturity stages, performing stomach contents analyses and collecting material for reproductive studies. Otoliths of these four species were also taken for age determination. In 2016, 629 length samples were taken, with 64,256 individuals of different species examined to obtain the length distributions (Table 2). Length and age distributions presented in this paper are based on sampling carried out by these observers. Length-weight relationships parameters used to calculate the Sum Of Products (SOP) of the length distribution are shown by species and stocks in Table 6. These relationships were estimated based on the data collected in the European Union surveys information carried out in 2016 in the NAFO Regulatory Area (NRA).

The Spanish activity en the NRA Subarea 3 in 2016, stock by stock, was the following:

### Cod

**Div. 3L:** In Div. 3L, the most important part of the catches of this species were taken as by-catch in the redfish fishery. Table 7 shows the catch length distribution for Div. 3L cod. The bulk of the catches are comprised in the 30-50 cm range.

**Div. 3NO:** In Div. 3N, the most important part of the catches of this species were taken as by-catch in the skate fishery (91%) and in less degree in the redfish fishery (9%). In Div. 3O were taken the 22% of the Spanish catches of this stock and were by catch of the redfish and skate fisheries. Table 8 shows the catch length distribution for Div. 3NO cod. The bulk of the catches are comprised in the 35-110 cm range.

**Div. 3M:** Catches in Div. 3M were 1,232 tons and most of them were taken in the direct fishery. A small part was taken as by catch of the redfish fishery. The legal mesh size of the Cod fishery is 130 mm. In 2016 only trawlers operated in this fishery. The total length distributions of the Spanish catches are presented in Table 9 and we can observe that catches length distributions presents a bimodal distribution with 25-42 and 46-74 cm range. The mode in 2016 was around 37 cm. An important part of the specimens caught in 2016 were below the minimum landing size (41 cm).

### Redfish

**3M:** In Div. 3M the redfish catches in 2016 have been 1402 tons and most of them were catch in a direct fishery and a small part of them was taken as by-catch in the cod fishery. Table 10 shows the Spanish catches length distribution for redfish Division 3M and it can be observed that the bulk of the catches are in the 24-35 cm range. This length distribution of catches in Div. 3M are bigger than the observed in Div 3O.

**Div. 3LN:** Spanish catches in 2016 were 235 tons. Most of the catches were taken in the reopened fishery for this stock. Table 11 shows the Spanish catches length distribution for redfish Division 3LN and it can be observed that the bulk of the catches are in the 20-30 cm range. This length distribution of catches in Div. 3LN is similar to the observed in Div. 3M and bigger than the observed in Div 3O.

**Div. 3O:** A directed fishery for this species took place in Div. 3O. Catches have reached 1663 tons in this Division, most of them with 130 mm mesh size. Catches length distribution for Div. 3O are presented in Table 12 and it can be observed that are smaller (19-28 cm) than the observed in Div. 3M and Div. 3LN.

### American plaice

**Div. 3LNO:** Spanish catches in 2016 in Div. 3LNO were 215 tons. Most of the catches were taken with 280 mm mesh size (153 tons) as by-catch of the skate fishery and in less degree with 130 mm mesh size (62 tons). Length distributions with 280 mm mesh size have a bigger length range than the 130 mm mesh size. Table 13 presents the total length distribution for Div. 3LNO. It can be observed a clear different length between sexes, males are smaller than females. The bulk of catches were in the range of 28-48 cm.

**Div. 3M:** Catches in Div. 3M only amounted 24 tons and most of them were taken as by-catch of the cod and redfish fisheries. Table 14 presents the total length distribution for Div. 3M. As in the Div. 3LNO American plaice stock, it can be observed a clear different length between sexes, males are smaller than females. The bulk of catches were in the range of 37-55 cm.

### Witch flounder

**Div. 2J and 3KL:** Spanish catches for this stock in 2016 were 28 tons and were taken in the small part of NAFO Regulatory Area (NRA) of Div. 3L as by catch of the Greenland halibut and redfish fishery. Table 15 shows the total Spanish length distribution for this species. The bulk of catches were in the range of 32-43 cm. As in the American plaice case, this species presents a clear different length distribution between sexes, males are smaller than females.

**Div. 3M:** This species in this Division was taken as by-catch in the Cod and redfish fishery. Catches this year were 20 tons and there is not management stock for this species in this Division. In 2016 there are some available catches length distributions for this species in Divisions 3M but the number of specimens measured in each sample was very low and therefore they are not considered representative of the size distribution of this species.

**Div. 3NO:** Spanish catches for this stock in 2016 were 49 tons. Most of the catches were taken with 130 mm cod end gear in a direct fishery and as by-catch of the Redfish and Greenland halibut fisheries (90%) and in less degree in the skate fishery (10%). Table 16 shows the total Spanish length distribution for this species. The bulk of catches were in the range of 28-46 cm. In this case the different length distributions between sexes are less evident.

### Yellowtail flounder

**Div. 3LNO:** In 2016 the yellowtail flounder Spanish catches were 283 tons. Most of the catches were taken in Div. 3NO in the skate fishery (268 tons) as by-catch. Catches in Div. 3L were only 1 tons taken with 130 mm mesh size gear. Length distributions for yellowtail flounder in Div. 3LNO are presented in Table 17. Most of the catches are in the 30-40 cm length range. Females are more abundant and bigger than males in the catches.

### Greenland halibut

**Subareas 2 and Div. 3KLMNO:** Greenland halibut continues to be one of the main target species for the Spanish fleet in NAFO area. In 2016 Spanish catches were 4,082 tons; most of them have been taken in the Flemish Pass area (Div. 3LM) at depths more than 700 m. The mesh size used for this fishery was equal or greater than 130 mm. Tables 18 shows the length distributions of Spanish catches by Division (3L, 3M, 3N and 3O) and the total length distributions of Spanish catches in Divisions 3LMNO. Most of the catches were in the 41-61 cm length range and the mode of the length distribution was in 52 cm. This length distribution is bigger than the 2013 where the mode was around 41 cm. Total age composition based in the commercial Spanish Age Length Key (Table 24), mean weight and mean length at age for Div. 3LMNO are presented in Table 19. Most of the Greenland halibut catches corresponds to ages 5 to 10 with a peak at ages 7. This age catch age distribution is similar to the last years.

Figure 2 presents the Spanish fleet standardised CPUE updated with the 2016 data presented by Gonzalez-Costas and Gonzalez-Troncoso (2009). Results show two periods with different levels in the CPUE: one between 1992-2006 and other 2007-2015. In the last period the CPUE has been variable between years but the mean level of this period was higher than the period 1992-2006. Between 2015 and 2016 there has been a large increase in CPUE, with the value of 2016 being the highest in the whole series.

### **Thorny skate**

Commercial catches of skates comprise a mix of skate species (*Raja radiata*, *Bathyraja spinicauda*, *Raja hyperboreana*, *Raja senta*, etc). Thus the catch of skate in Table 1 refers to Raja spp. However, thorny skate dominates, comprising about 90% of the skate taken in the Spanish catches base on 2014-2016 data from the EU Spanish 3NO Survey.

**Div. 3LNO:** Spanish skate catches in 2016 were 2,819 tons. Most of the catches were taken in Div. 3N at depths less than 200 meters, where a fishery directed to thorny skate took place using 280 mm mesh size. Skate catches in Div. 3L (21 tons) were much smaller than those in Div. 3NO and they were by-catch of the Greenland halibut fishery (130 mm cod-end). Table 20 shows the total catches length distributions by sex of Div. 3LNO, all catches length samples were with 280 mm mesh size and they were taken in Division 3NO. Most of the catches were in the 29-74 cm length range, similar to years before. It can be observed a clear different length between sexes, males are bigger than females.

**Div. 3M:** Skate catches in Div. 3M (15 tons) were much smaller than those in Div. 3NO and they were by-catch of the Greenland halibut, redfish and cod fisheries. There is not available catches length distributions for this species in Division 3M.

### **Roughhead grenadier**

**Subarea 2 and 3:** Roughhead grenadier is the main species taken as by-catch in the Greenland halibut fishery. Most of the 2016 catches and most of the length distribution samples were taken in Div. 3LM. Individuals were measured from tip of snout to base of first anal-fin ray (AFL) to the half centimetre below. Spanish catches in 2016 were 67 tons. Table 21 shows the AFL length distributions, grouping in 1 cm intervals, of Spanish catches for Div. 3LMNO. Most of the catches were in the 11-26 AFL length range, with a mode in 18 cm and a clear length difference between sexes, males are smaller than females.

Age distributions based on the Spanish commercial Age Length Key (Table 25), mean weight and mean length (AFL) at age of the total catch for Div. 3LMNO are presented in Table 22. Most of the Roughhead grenadier catches in 2016 were based on ages 4 to 14 with a mode in 6-8 years old. This age distribution is smaller than the observed in the previous years where the mode was around 8-10 years old.

### **White hake**

**Div. 3NO:** Catches of this species in 2016 in Div 3NO (78 tons) were a small by-catch of different fisheries. In Division 3NO part of the catches (11 tons) were taken with the 280 mesh size. Catches in Div. 3NO take with 130 mm mesh size (108 tons) are by-catch of the redfish fishery. Table 23 shows the total catches length distributions by sex of Div. 3NO. It was only available three length distribution sample for 280 mm mesh size with a small number of measured individuals. Due to this problem, this sample could not be very representative of the catches distributions. Most of the catches were in the 17-22 cm length range.

### **(B) Research studies**

The Spanish bottom trawl survey in NAFO Regulatory Area Div. 3NO was conducted from 23rd of May to the 21st of June 2016 on board the R/V Vizconde de Eza. The gear was a Campelen otter trawl with 20 mm mesh size in the cod-end. Prior to the survey, the effect of reducing the number of hauls was investigated, concluding that 7 hauls from the larger strata could be made redundant with hardly any difference in the resulting survey indexes. Thus a total of 115 valid hauls were taken within a depth range of 45-1480 m according to a stratified random design. This year we implemented a grid for the hydrographic profiles, with sampling points at 15 nm intervals on the shallower area and radials on the slope, instead of casting the data logger in each fishing station. This system however did not quite work for this survey, as it requires additional steaming time that we cannot afford in terms of working hours. The data logger we used failed in most cases deeper than 500 m, producing profiles with noise in a various range of depths, usually starting at 400 m. This problem persisted for nearly half of the survey. Furthermore, a stratified sampling by length class and sex was used to sample otoliths of Atlantic cod (605), American plaice (258) and Greenland halibut (319) for growth studies. Also, gonads of Atlantic cod (313) and American plaice (116) were sampled from histological maturity and fecundity studies. The results of this survey, including biomass indices with their errors and length distributions, as well as the calculated biomass based on conversion of length frequencies for Greenland halibut, American plaice, Atlantic

cod, yellowtail flounder, redfish, witch flounder, roughhead grenadier, thorny skate and white hake are presented as Scientific Council Research Documents. In addition, age distributions are presented for Greenland halibut and Atlantic cod.

In 2003 it was decided to extend the Spanish 3NO survey toward Div. 3L (Flemish Pass). In 2016, the bottom trawl survey in Flemish Pass (Div. 3L) was carried out on board R/V Vizconde de Eza using the usual survey gear (Campelen 1800) from July 28th to August 17th. The area surveyed was Flemish Pass to depths up 800 fathoms (1463 m) following the same procedure as in previous years. The number of hauls was 105 and 8 of them were nulls. Survey results, including abundance indices and length distributions of the main commercial species, are presented as Scientific Council Research documents. Survey results for Div. 3LNO of the northern shrimp (*Pandalus borealis*) were presented in SCR 16/052.

Samples for histological (cod, American plaice, roughhead grenadier) and aging (Greenland halibut, American plaice, roughhead grenadier and cod) studies were taken. Feeding studies on demersal species were performed and 3291 stomach contents were analysed in depths of 126 to 1447 m. Ninety-seven hydrographic profile samplings were made in a depth range of 108-1430 m.

The EU bottom trawl survey in Flemish Cap (Div. 3M) was carried out on board R/V Vizconde de Eza using the usual survey gear (Lofoten) from June 22th to July 23th 2016. The area surveyed was Flemish Cap Bank to depths up to 800 fathoms (1460 m) following the same procedure as in previous years. The number of hauls was 182 and one of them was null. Survey results including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice, roughhead grenadier and Greenland halibut are presented as Scientific Council Research documents. Flemish Cap survey results for northern shrimp (*Pandalus borealis*) were presented in SCR 16/051. Samples for histological assessment of sexual maturity of cod, redfish, Greenland halibut and roughhead grenadier were taken. Oceanography studies continued to take place.

#### Surveys 2016 data on VME from bottom trawl groundfish surveys in NAFO Regulatory Area (Divs. 3LMNO):

New data on deep-water corals and sponges were presented from the 2016 EU and EU-Spanish bottom trawl groundfish surveys for 2016, and 2015 fall Canadian multispecies surveys. The data was made available to the NAFO WGESA to improve the mapping of Vulnerable Marine Species in the NAFO Regulatory Area (Divs. 3LMNO).

“Significant” catches (according to the NAFO definition from groundfish surveys) of deep-water corals and sponges were provided and mapped together with the closed areas. A total number of 480 bottom trawl hauls surveys were analyzed. Distribution maps of presence and catches above threshold for RV data of sponges, large gorgonians, small gorgonians and sea pens following the thresholds were presented.

**Sponges:** For the Spanish/EU 2016 data, sponges were recorded in 248 of the total tows (61.5% of the total tows analyzed). Significant catches of sponge ( $\geq 75$  kg/tow) were found in 12 EU tows. The majority of these catches ( $n = 7$ ) were located in the southern part of Flemish Pass in closed area 2; the others were located around Flemish Cap including: 1 in closed area 5, 1 within Beothuk Knoll sponge polygon, 1 within the northern Flemish Cap polygon, 1 adjacent to closed area 10, and 1 on the Sackville Spur. Of the total 12 tows, 4 were recorded outside of the closed areas with 2 of those falling within sponge polygons. Sponge catches for these tows ranged between 89.4 and 2238.5 kg.

For the Canadian 2015 data, sponges were recorded in 38 of the total tows (49.3% of the total tows analyzed), with depths ranging between 44 - 673 m. There were no significant catches of sponge ( $\geq 75$  kg/tow). Of the 38 sponge catches observed, all were  $< 19$  kg; 2 were located within the NAFO closure 2, and 2 located within sponge polygon near closure 2.

**Larges gorgonians:** For the Spanish/EU 2016 data, large gorgonians were recorded in 9 tows (2.2% of the total tows analyzed) with depths ranging between 516 - 1433 m. There were no significant catches but of the 9 tows that recorded large gorgonians (weights between 0.004-0.4 kg), 3 tows were located within closures (2 in closure 2, and 1 in closure 4), 1 within Beothuk Knoll polygon, and 4 records in close proximity to closures.

For the Canadian 2015 data, large gorgonians were recorded in 5 tows (6.5% of the total tows analyzed) with depths ranging between 243-651 m. There were 2 significant catches, 1 adjacent to the southern portion of closure 2 and the other located on the Sackville Spur. Other catches, below the threshold, were observed on Sackville Spur and 2 on the tail of the Grand Bank.

**Small Gorgonians:** For the Spanish/EU 2016 data, small gorgonians were recorded in 42 tows (10.4 % of the total tows analyzed), with depths ranging between 137 - 1415 m. Significant catches ( $> 0.15$  kg/tow) were recorded in 2 tows (0.5% of the total tows) with both located on the tail of the Grand Bank. Other observations of small gorgonians were recorded throughout the NRA with 5 tows found within current closures (closures 2 and 5), and many others found adjacent to closures.

For the Canadian 2015 data, small gorgonians were recorded in 2 tows (2.6 % of the total tows analyzed), with depths of 223 - 307 m. There were no significant catches ( $> 0.15$  kg/tow) recorded, and 2 observations were found on the tail of the Grand Bank.

**Sea Pens:** For the Spanish/EU 2016 data, sea pens were recorded in 133 tows (33% of the total tows analyzed) with depths ranging between 824 - 1164 m. Significant catches ( $> 1.4$  kg/tow) were recorded in 4 tows (1.5-2.39 kg) with all located outside closed areas. Three of these significant catches were found within two adjacent polygons and the 4th located between the polygons. Other observations of sea pens were recorded throughout the NRA with 6 tows found within closure 2, 1 tow in closure 4, and 20 found within sea pen polygons.

For the Canadian 2015 data, sea pens were recorded in 7 tows (9% of the total tows analyzed) with depths ranging between 241 - 651 m. There were no significant catches ( $> 1.4$  kg/tow) recorded. Other sea pen observations were documented with 2 in the vicinity of Sackville Spur, 1 in Flemish Pass and a cluster of 4 observations on the tail of the Gran Bank near the Canadian EEZ.

## SUBAREA 6

### **A. Status of the fisheries**

One Spanish trawler operated during 2016 in Div. 6G NAFO Regulatory Area using a midwater trawl gear. The fishing effort of this trawler was 16 days (116 hours). The most important species in catches was the *Beryx splendens* (Table 1).

**Alfonsino Div. 6G:** Catches of this species in 2016 in Div 6G were 127 tons made with a midwater trawl gear. Table 26 shows the total catches length distributions by sex of Div. 6G. Most of the catches were in the 36-43 cm total length range.

### **Acknowledgements**

The collection of the data presented in this document has been funded by the European Union through the European Maritime and Fisheries Fund (EMFF) within the National Program of collection, management and use of data in the fisheries sector and support for scientific advice regarding the Common Fisheries Policy.
