**SCIENTIFIC COUNCIL MEETING – JUNE 2017**

## PORTUGUESE RESEARCH REPORT FOR 2016

by

J. Vargas, R. Alpoim, E. Santos and A. M. Ávila de Melo

INSTITUTO PORTUGUÊS DO MAR E DA ATMOSFERA – IPMA, I.P.  
Av. Dr. ALFREDO MAGALHÃES RAMALHO, 6, 1495-006, LISBOA, PORTUGAL

**A. Status of the fisheries**

In 2016, the Portuguese provisional nominal catches proceeding from NAFO Regulatory Sub Area 3 reached 19 750 t (Table 1-A). Nominal catches increased continuously from 2000 to 2003, when they peaked at 22 700 ton, but declined sharply afterwards (Table I-B); during 2004- 2008 catches stabilized between 11 700 and 13 500 t. Since 2009 catches increased from around 15 400 ton (2009-2010) to around 19 000 t (2016).

The 2016 fishing effort (Table II) and the catches are provisional (data extracted from NAFO Database STATLANT 21A on 25 May 2017 and STATLANT 21B on 14 June 2017). In 2016, 9 trawlers composed the Portuguese fleet that operated in the NAFO area.

Due to the reopening, in 2010, of the fishery for cod in Div 3M (Flemish Cap), this species represents now 56% of the total catch in this division and 30% of the Portuguese catches in all Sub Area 3.

Catches of redfish tripled its value from 2013 (571 ton) to 2015-2016 (around 1600 ton) in Div. 3L and in Div. 3N catches oscillated between 250 and 400 ton in the same period. In Div. 3M, from 2015 to 2016, the redfish catches increased around 1 400 ton, representing now 36% of the total catches in this division and 19% of the Portuguese catches in all Sub Area 3. In Div. 30, catches of redfish remained relatively stable in recent years and represents about 80% of the total catches in this division and around 20% of the Portuguese catches in all Sub Area 3. Redfish remains by far the most important species in the Portuguese commercial catches from Sub Area 3, representing in recent years around 50% of the overall catch.

After remaining more or less stable in previous years, the Greenland halibut catches in the divisions 3L and 3M decreased 17% in 2015 and in 2016 remains at the 2015 levels. In Div. 30, the Greenland halibut catches fell than by half from 2015 to 2016.

Roughhead grenadier catches in recent years are mainly by-catch of the Greenland halibut fishery and have been decreasing year by year. The witch flounder catches, that in 2015 decreased to residual values (55 ton in all Subarea 3), reached in 2016 221 ton (due the increase of 80 ton in both Div. 3M and 30). Skates catches in Subarea 3 remains stable at the level of 370 ton, the bulk of the catches come from Div. 3N and Div. 30. The 30 division catches of silver hake almost doubled, returning to the values of 2014 (at the level of 400 ton). The shrimp fishery in Div. 3L, that in 2009 its catches reached 20% of the total catch in this division, declined significantly in 2010. Portugal stopped fishing shrimp in 2013. The catches of other species remained more or less stable in all divisions.

Greenland halibut together with redfish continues to be the bulk of the catch on Div. 3L (more than 85% of the overall catch since 2009). The catch in Div. 3M (mainly cod and redfish) continue in 2016, like in most 3 recent years, to represent around 50% of the total catch. This division is, at present, the most important ground for

the Portuguese NAFO fishery (50% of the annual catches), but cod replaced redfish as the most important fishery. From 2012 to 2015, the catches in Div. 3N fell by half and in 2016 decreased again 214 ton, being now redfish (56%) and skates (27%) catches the most representative in the total Div. 3N catches; the catches of Greenland halibut are now almost residual (6%). On division 30, redfish continues by far the most important fishery.

## **B. Portuguese Annual Sampling Program**

### **1. Catch and effort sampling.**

Effort and CPUE data for 2016 Portuguese trawl fishery on the NAFO Regulatory Area were obtained through the revision of skipper logbooks from two trawlers, kindly supplied by its owners. All the information (round weight of the catch by species, fishing effort, positions and depths) has been recorded on a tow-by-tow basis. The vessel conversion factors were used to convert its processed landings in catches.

The daily catch and effort data from the logbook were used to estimate the directed effort and CPUE for each of the target species/stock, as well as the main by-catch species and depth range of the different fisheries, on a monthly basis. From the data available, the majority of the fishing effort was directed towards cod, redfish and Greenland halibut (Table III). Data regarding directed effort and catch rates of the Greenland halibut fishery are presented in Table III to IV-B and Fig. 1.

The Greenland halibut CPUE series was updated with the 2016 observed CPUEs. The additive model (Ávila de Melo and Alpoim, 1995), was upgraded in 1998 (Alpoim *et al.*, 1998) and used, like in previous years, to standardize the observed CPUEs, but excluding the vessel factor because the sampling program in recent years was carried out on vessels that were not sampled before. If the vessel factor is applied, these new vessels will increase a lot the noise. Because they are the only vessels sampled in the recent years, we assumed that all vessels belong to the same category what is realistic. From January 1988 till April 1995 each monthly observed CPUE of this series was previously corrected for 130mm mesh size (Ávila de Melo and Alpoim, 1996). In this analysis, any observation corresponding to a month and a trawler with less than 10 hours of directed effort was rejected. The CPUEs are presented in Tables IV and Fig. 1, with the associated standard errors (+/- 2 standard errors in the Figures) and coefficients of variation.

#### **1.1. Comments on catch and effort data (based on the vessels sampled)**

##### **1.1.1. Greenland halibut in Div. 3L, 3M, 3N and 30**

In Div. 3L catch rates declined prior to the boom of the deep-water fishery (Table IV-A, Fig. 1). However, it is from 1990 to 1991, i.e. from the first to the second year of this new fishery in the Regulatory Area, that CPUEs fell by half. Between 1991 and 1994 catch rates remained stable at a low level. Since then, catch rates gradually increased, reaching an upper level in 1999-2000. Catch rates declined in 2001 and remained stable at that lower level in 2002 and 2003. In 2004 the catch rates decline again, reaching the lowest value since 1994. However, after 2004, the Greenland halibut catch rates recovered continuously and, despite the high variability from 2006 to 2016, the catch rates reached, in this period, the highest values observed of the time series (0.833 ton/h in 2016).

Div. 3M catch rates, despite more noisy, follows the same trend as the ones in Div. 3L.

For all Div. 3LMNO combined (Table IV-A, Fig. 1) the observed catch rates series follows the Div. 3L pattern, since this is the division of Sub Area 3 with the highest concentration of Greenland halibut fishing effort.

## **2. Biological Sampling**

In 2016, biological sampling was obtained from two stern trawlers fishing in Div. 3L, 3M, 3N and 30 during all the year. Apart from species under moratoria, a priority to be sampled whenever they appear in the hauls,

biological sampling was conducted for the two most abundant species in each haul, following the NAFO sampling recommendations.

Cod, redfish (*S. mentella*) and American plaice were sampled in Div. 3L, 3M, 3N and 30 (Tab. V). Witch flounder was sampled in Div. 3L, 3M and 30. Greenland halibut was sampled in Div. 3L and 3M. Roughhead grenadier was sampled only in Div. 3L. Redfish (*S. marinus*) were sampled only in Div. 3M and white hake and haddock only in Div. 30.

Since 1996, all commercial information is representative of the catch as a whole, although sampling continues to be carried out by sex, with the exception of cod, white hake, Atlantic halibut and haddock. Mean weight and mean weight in the catch are derived from the length-weight relationships calculated from the commercial sampling in 2016 and are presented in Table VI. However, for species/stock with a low sampling level in 2016, the length-weight relationships calculated in previous years were used.

## **2.1. Catch and by-catch composition of the 2016 trawl fishery (130mm codend mesh size).**

The regular mesh size in the codend used by the monitored trawlers fishing groundfish was the 130mm and, when the mesh size is not mentioned it, means that the sample refers to the 130mm mesh size. However, in 2016, no one set was made with 200mm/280mm mesh size in the codend by the monitored vessels.

### **2.1.1. Cod Div. 3L**

Information on length composition of the cod by-catch in Div. 3L is available for May and June (Table VII, Fig. 2), from 291 m to 467 m depth.

Lengths between 39 cm and 48 cm dominated the catch, with a modal class at 39 cm (mean length and weight of 45.3 cm and 1013 g).

### **2.1.2. Cod Div. 3M**

Information on length composition of the cod trawl catch in Div. 3M is available from January to November, except for April, August and October (Table VIII, Fig. 3), from 144 m to 650 m depth.

Lengths between 39 cm and 48 cm dominated the catch, with a modal class at 39 cm (mean length and weight of 52.3 cm and 1934 g).

### **2.1.3. Cod Div. 3N**

Information on length composition of the cod by-catch in Div. 3N is available for May and June (Table IX, Fig. 4), from 257 m to 492 m depth.

Despite the small sampling (3 samples, 335 fish measured), we can conclude that lengths between 30 cm and 45 cm dominated the catch, with a very modal class at 39 cm (mean length and weight of 39.6 cm and 621 g).

### **2.1.4. Cod Div. 30**

Information on length composition of the cod by-catch in Div. 30 is available for May and June (Table X, Fig. 5), from 123 m to 486 m depth.

Lengths between 39 cm and 51 cm dominated the catch, with three modal classes at modal class at 39 cm, 42 cm and 48 cm (mean length and weight of 48.2 cm and 1038 g).

### **2.1.5. Redfish (*S. mentella*) Div. 3L**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3L is available from May to November (Table XI, Fig. 6), from 291 m to 488 m depth.

Lengths between 21 cm and 26 cm dominated the catch, with a modal class at 23 cm (mean length and weight of 24.3 cm and 167 g).

### **2.1.6. Redfish (*S. mentella*) Div. 3M**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3M is available from January to July, except for April (Table XII, Fig. 7), from 159 m to 650 m depth.

Lengths between 20 cm and 24 cm dominated the catch, with a modal class at 22 cm (mean length and weight of 23.7 cm and 197 g).

### **2.1.7. Redfish (*S. mentella*) Div. 3N**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3N is available for May and June and from September to November (Table XIII, Fig. 8), from 257 m to 492 m depth.

Lengths between 21 cm and 26 cm dominated the catch, with two very modal classes at 22 cm and 23 cm (mean length and weight of 23.5 cm and 146 g).

### **2.1.8. Redfish (*S. mentella*) Div. 3O**

Information on length composition of the redfish (*S. mentella*) trawl catches in Div. 3O is available from May to November, except for August (Table XIV, Fig. 9), from 137 m to 504 m depth.

Lengths between 19 cm and 23 cm dominated the catches, with a very modal classes at 20 cm and 22 cm (mean length and weight of 21.1 cm and 105 g).

### **2.1.9. Redfish (*S. marinus*) Div. 3M**

Information on length composition of the redfish (*S. marinus*) trawl catches in Div. 3M is available for January, June and July (Table XV, Fig. 10), from 172 m to 585 m depth.

Lengths at 25 cm and between 27 cm and 33 cm dominated the catches, with a modal class at 31 cm (mean length and weight of 29.7 cm and 360 g).

### **2.1.10. American plaice Div. 3L**

Information on length composition of the American plaice by-catch in Div. 3L is available for May and June (Table XVI, Fig. 11), from 292 m to 467 m depth.

Lengths between 22 and 32 cm dominated the catch, with two modal classes at 30 cm and 32 cm (mean length and weight of 28.2 cm and 224 g).

### **2.1.11. American plaice Div. 3M**

Information on length composition of the American plaice by-catch in Div. 3M is available from January to July, except for April, (Table XVII, Fig. 12), from 152 m to 636 m depth.

Lengths between 28 and 34 cm dominated the catch, with two very modal classes at 30 cm and 32 cm (mean length and weight of 32 cm and 311 g).

### **2.1.12. American plaice Div. 3N**

Information on length composition of the American plaice by-catch in Div. 3N is available for May and June (Table XVIII, Fig. 13), from 257 m to 492 m depth.

Despite the small sampling (3 samples, 307 fish measured), we can conclude that lengths between 26 and 32 cm dominated the catch, with a very modal class at 30 cm (mean length and weight of 31.3 cm and 293 g).

### **2.1.13. American plaice Div. 3O**

Information on length composition of the American plaice by-catch in Div. 3O is available from May to November, except for July and August (Table XIX, Fig. 14), from 128 m to 520 m depth.

Lengths between 26 and 34 cm dominated the catch, with two modal classes at 30 cm and 32 cm (mean length and weight of 30.8 cm and 281 g).

### **2.1.14. Greenland halibut Div. 3L**

Information on length composition of the Greenland halibut catches in Div. 3L is available from January to November, except for April and August (Table XX, Fig. 15), from 292 m to 1425 m depth.

Lengths between 40 cm and 50 cm dominated the catch, with a modal class at 40 cm (mean length and weight of 45.4 cm and 962 g).

### **2.1.15. Greenland halibut Div. 3M**

Information on length composition of the Greenland halibut catches in Div. 3M is available only for January (Table XXI, Fig. 16), from 692 m to 705 m depth.

Because the small sampling (1 sample, 202 fish measured), nothing can be concluded about the dominant length classes (mean length and weight of 44.1 cm and 843 g).

### **2.1.16. Roughhead grenadier Div. 3L**

Information on length composition of the roughhead grenadier catches in Div. 3L is available for January and February, June and July, and October and November (Table XXII, Fig. 17), from 836 m to 1243 m depth.

Anal fin lengths between 8 cm and 10 cm dominated the catch, with a two modal classes at 9 cm and 10 cm (mean length and weight of 10.3 cm and 124 g).

### **2.1.17. Witch flounder Div. 3L**

Information on length composition of the witch flounder by-catch in Div. 3L is available for May and June (Table XXIII, Fig. 18), from 300 m to 483 m depth.

Lengths between 28 cm and 34 cm dominated the catch, with a very clear modal class at 30 cm (mean length and weight of 31.6 cm and 379 g).

### **2.1.18. Witch flounder Div. 3M**

Information on length composition of the witch flounder by-catch in Div. 3M is available for February and from May to July (Table XXIV Fig. 19), from 159 m to 621 m depth.

Lengths between 28 cm and 34 cm dominated the catch, with a very clear modal class at 30 cm (mean length and weight of 32.2 cm and 399 g).

### **2.1.19. Witch flounder Div. 30**

Information on length composition of the witch flounder by-catch in Div. 30 is available for May and June (Table XXV, Fig. 20), from 123 m to 486 m depth.

Lengths between 26 cm and 34 cm dominated the catch, with a very clear modal class at 32 cm (mean length and weight of 31.7 cm and 177 g).

### **2.1.20. White hake Div. 30**

Information on length composition of the white hake catches in Div. 30 is available for May and June (Table XXVI, Fig. 21), from 123 m to 389 m depth.

Despite the large range of lengths, the data show that lengths between 42 cm and 46 cm and at 50 cm dominated the catch (mean length and weight of 45.6 cm and 806 g).

### **2.1.21. Haddock Div. 30**

Information on length composition of the haddock catches in Div. 30 is available only for May (Table XXVII, Fig. 22), from 134 m to 218 m depth.

Despite the large range of lengths, the data show that lengths between 45 cm and 51 cm dominated the catch (mean length and weight of 47.3 cm and 876 g).
