Annex B Fishing vessel operated in recent years (2016-2022)-----	25

## 1. Introduction

Japan joined NAFO in 1980 and has conducted fishing operations in the Convention area continuously for 29 years (1980-2008). From 2009, fishing operations stopped for 7 years (2009-2015) due to various reasons, i.e., socio-economics problems of fishing companies, Tsunami disasters (2011) and others. Fishing operations resumed in 2016 with one otter trawl fishing vessel and have continued till now (2022) (7<sup>th</sup> year after the resumption).

This document is the National Research Report (Japan), responding to a series of requests by SC and NAFO Secretariat (Table 1). Table 1 summarizes progress of these requests as reference.

**Table 1.** Summary of requests by SC and the Secretariat and responses by Japan (as of May 7, 2022).

Information requested	NAFO circulation No.	Deadline	Response
Environmental data		May 7, 2022	No data available

<ul style="list-style-type: none"> <li>• List of Tag Releases in 2021 and early 2022</li> </ul>			None
<ul style="list-style-type: none"> <li>• Information on research vessel surveys on a stock-by-stock basis</li> </ul>			No research vessel surveys
<ul style="list-style-type: none"> <li>• STATLANT 21B</li> </ul>		Aug 31, 2022	To be submitted by Fisheries Agency of JAPAN .

## **2. Data (1980-2021)**

Three data sources used for this National Research Report of Japan are 'STATLANT21A (1980-2021)', 'STATLANT21B (1980-2021)' and 'Japanese Observer data (2016-2021)', which were officially provided by the Fisheries Agency of JAPAN.

## **3. Overviews (NAFO CA) (1980-2021)**

Before describing subarea-based information, the overall situation (1980-2021) since Japan joined NAFO in 1980, is reviewed.

### **3.1 Gear types**

Table 2 shows gear types used in operations by year based on STATLANT 21 available in the NAFO database downloaded from the NAFO homepage (April 2022). Circles indicated gear types used, but numbers of vessels are unknown. Only the numbers of bottom otter trawlers operated are available, which were obtained from Ms Jana Aker (NAFO Fisheries Information Administrator) (January 2019) and the Fisheries Agency of Japan (September 2021). However, numbers are unknown for nine years. As the numbers of vessels by gear type are the fundamental information and important, we plan to further investigate them in the future.

**Table 2.** Gear types used in fishing operations (1980-2021).

Gear types used in fishing operations by Japan. Circles indicate that at least one vessel used the corresponding gear, but actual number of boats are unknown except bottom otter trawl in column [A]

\*: Sources from NAFO Secretariat (1980,1983,1986,1989) and Fisheries Agency of Japan (1993-2021).

?: numbers are unknown.

Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.

(1) Japan joined NAFO in 1980.

(2) Majority gear is the bottom otter trawl.

(3) Fishing vessel operated in recent years (2016-2021) is described in Annex B.

### 3.2. Catch by subarea (Table 3 and Map 1)

**Table 3.** Annual catch by sub-area (tons). All species and gears are combined (1980-2021).

Year	Subarea						Total	
	0	1	2	3	4	5		
1980				2,223	18,683	4,652	5,850	31,408

*Additional Note:*

- (1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (2) Japan jointed NAFO in 1980.
- (3) Majority gear is the bottom otter trawl.

**Map 1.** Map of NAFO CA highlighted subareas and Divisions.

Fig. 1 shows catch compositions among subareas (all species and gears combined but the majority gear is bottom otter trawler as indicated in Table 1). Japan operated in all of seven subareas (0-6) in the past, and subarea 3 was the major fishing ground during 1980-1996. From 1997 to now, subarea 3 is the only fishing ground for Japan.

Fig. 2 shows catch trends by subareas (all species and gears combined, but majority gears are bottom otter trawls). There is a shift of three different catch levels, i.e., during 1<sup>st</sup> stage (1980-1982), the catch level was the highest (15,000-31,000 tons), then in the 2<sup>nd</sup> stage (1983-1993) decreased by half (6,000-12,000 tons except 4,000 tons in 1983) and in the 3<sup>rd</sup> stage (1994-2008 and 2016-2021), it further decreased to less than 4,000 tons. The decreases are considered mainly due to constraints by TAC.

Subarea 3 has been the only fishing ground for Japan since 1997, thus this report describes the information in subarea 3.

**Figure 1.** Catch compositions among subareas(1980-2021). All species and gears are combined.

**Figure 2.** Catch by sub-areas (tons) (1998-2021). All species and gears are combined. No operations were done during 2009-2015.

Note:

- (1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (2) Japan joined NAFO in 1980.
- (3) Major gear used is the bottom otter trawl.

#### 4. SUBAREA 3

##### ***A. Status of the Fisheries***

*This should be broken down by species and should first indicate the changes that have been observed in the catches. Any available information regarding quantities of fish, by species if possible, being used for industrial purposes should also be presented. An explanation should follow for these changes based on scientists' best judgement. Reference to biological conditions (e.g. length and age composition), fishing conditions (e.g. effort and availability) and environmental conditions, should be made where necessary and appropriate. Any forecasts for the coming year should be included here. Graphic presentations supporting the text are acceptable.*

We will first review the overall situation in subarea 3 then will analyze by Division in subarea 3.

#### **4.1. Overview**

##### **(1) Fisheries**

Table 4 shows annual catch (tons) by Division in subarea 3 (all species and gears combined) (1980-2021). There are catch for almost all period in Division 3L+3M, while more in the first half for 3K+3N+3O.

Fig. 3 shows catch compositions among Divisions in subarea 3 (all species and gears combined). Japan operated in five Divisions (3K, 3L, 3M, 3N and 3O), but major fishing Division shifted by period, i.e., Division 3L was the major fishing ground in 1980-1981, then shifted to 3K (1984-1987), 3N (1988-1990), 3M (1991-1995), 3L (1996-2008), 3L+3M+3N (2016-2019) and 3L+3M in 2020 and 2021.

Fig. 4 shows annual catch trends by Division in subarea 3 (all species and gears combined). There are two different catch levels, i.e., the higher catch level (average 4,700 tons) in the first half period (1980-1993), while the lower level (average 2,600 tons) in the latter half period (1994-2008 and 2016-2021) resulting 2,100 tons difference.

**Table 4.** Annual catch by Division in sub-area 3 (tons). All species and gears are combined (1980-2021).

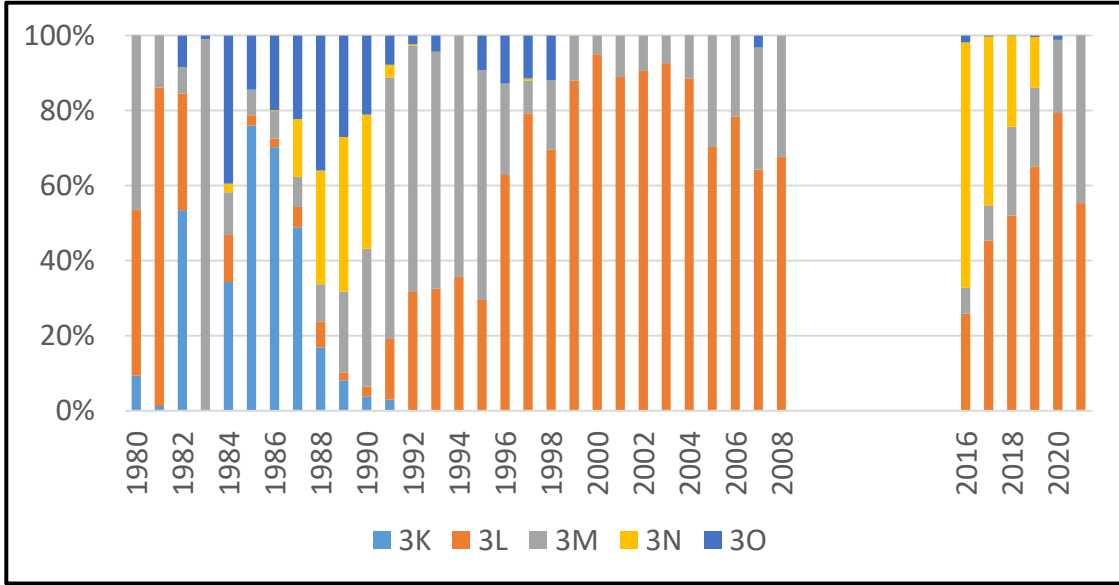

Year	Subarea					Total
	3K	3L	3M	3N	3O	
1980	208	983	1,030		2	2,223

### No operations

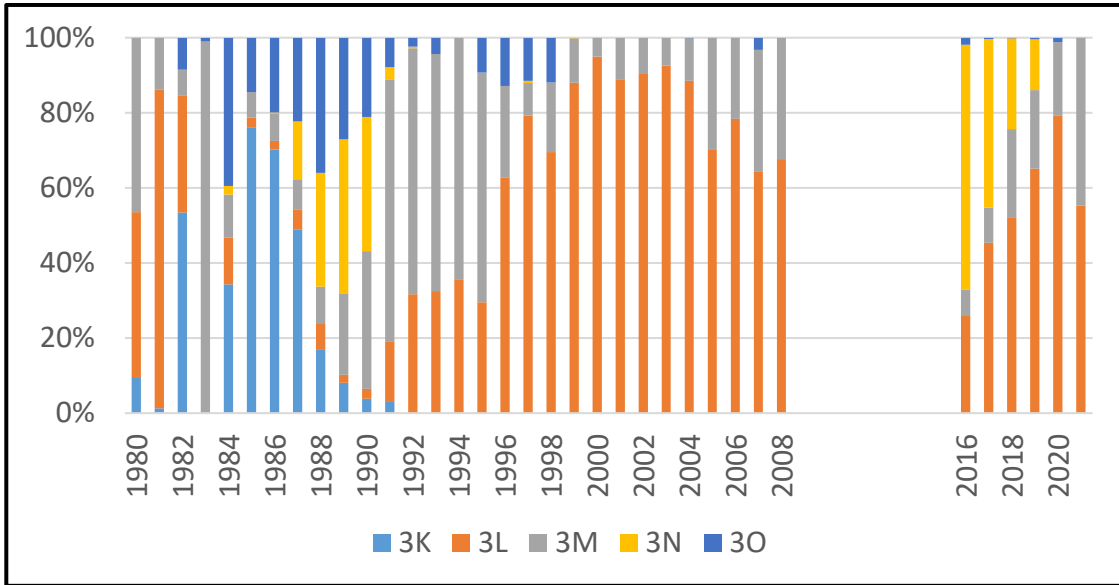

2016	624	168	1,573	44	2,409
2017	1,178	242	1,168	7	2,595
2018	1,555	707	724	4	2,990
2019	1,813	585	378	10	2,786
2020	1,399	344		21	1,764
2021	950	766		0	1,716

*Additional Note:*

- (1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (2) Japan joined NAFO in 1980.
- (3) Majority gear is the bottom otter trawl.

**Figure 3.** Catch compositions among Divisions in sub-area 3 (1980-2021). All species and gears are combined.

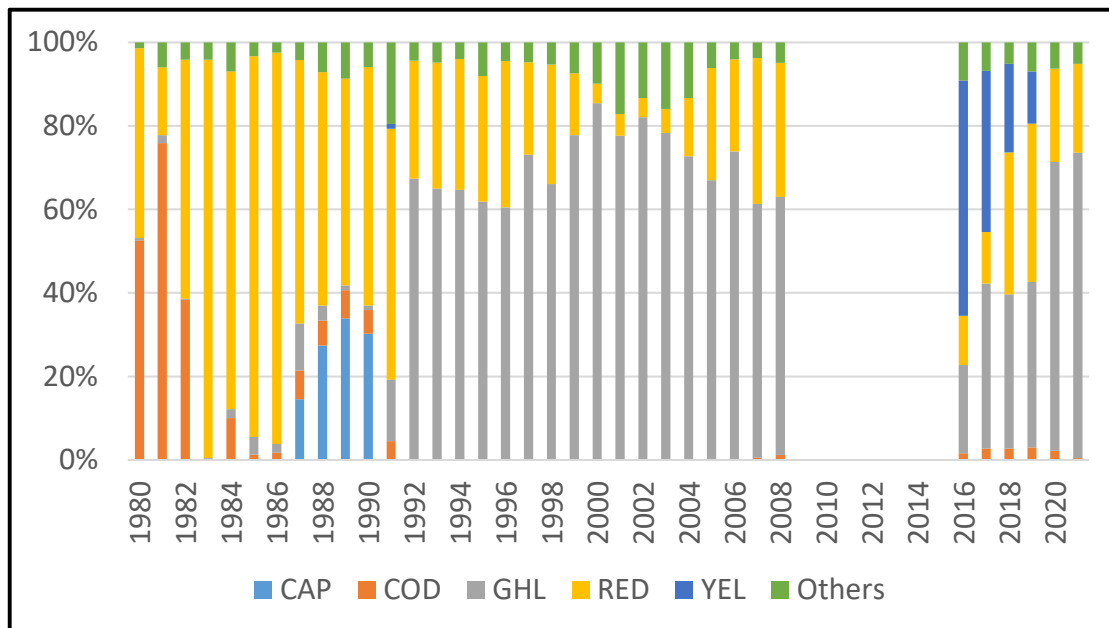

**Figure 4.** Annual catch (tons) by Division in sub-area 3. All species and gears are combined (1980-2021).  
Note:

- (1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (2) Japan joined NAFO in 1980.
- (3) Majority gear is the bottom otter trawl.

Fig 5 shows TAC species compositions of catch for Japan in subarea 3, i.e., Greenland halibut, Atlantic cod, Atlantic redfish, caplin and squid. Major species compositions vary by period, i.e., Atlantic cod and red fish (1980-1983), redfish (1984-1991), Greenland halibut and redfish (1992-2008), Greenland halibut, redfish and yellowtail flounder (2016-2019) and Greenland halibut and red fish (2020-2021). Yellowtail flounder is not TAC species for Japan, but its ratio was high in 2016-2017 because of quota transfers (Greenland halibut, red fish and yellowtail flounders) between Japan and Canada in 2016-2017, thus catch in this period did not reflect the allocation of quota (TAC).

**Figure 5.** Species compositions of catch in Subarea 3. All gears are combined (1980-2021).

Note:

- (1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (2) Japan joined NAFO in 1980.
- (3) Majority gear is the bottom otter trawl

Fig. 6 shows annual catch trends by species in subarea 3 during two periods (1980-2021 and 1994-2021). There are high and low catch level periods, i.e., high (1980-1993) (average=12,000 tons) and low (1994-2021) (Average=2,600 tons), which is 4-5 times difference. Yellowtail flounder catch was high (2016-2017) as explained above.

**Figure 6.** Catch by species (tons) in Subarea 3. All gears are combined (1980-2021: upper, 1994-2021: lower).

Note:

- (1) Horizontal broken lines represent averages.
- (2) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.
- (3) Japan jointed NAFO in 1980.
- (4) Majority gear is the bottom otter trawl.

**(2) Size frequencies (Total/Fork length by 0.5cm is shown in Annex A)**

**Greenland halibut**

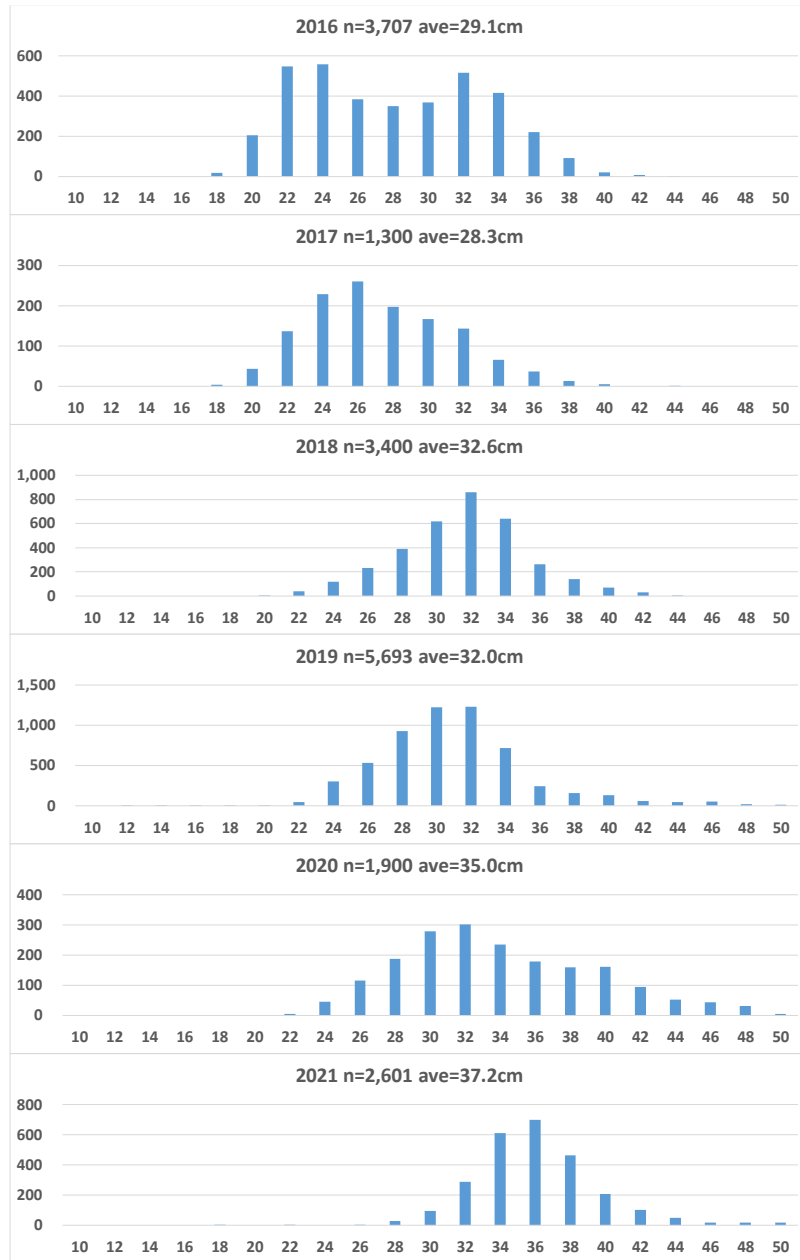

Size of Greenland halibut has become slightly smaller during 2017-2021 (about 48.7cm) than in 2016 (average=50.5cm).

**Figure 7.** Size frequency distribution based on the total length data measured by one on-board observer for Greenland halibut (2016-2021) (subarea 3).

**Red fish**

Average sizes (fork length) tended to be larger as years with the largest sizes in 2021 (ca. 37cm). Size frequency distributions formed the bimodal (peaks around in 23cm and 32 cm) in 2016 but the unimodal in 2017-2021 (peak was around 26cm in 2017, 32cm in 2018-2020 and 36cm in 2021).

**Figure 8.** Size frequency distribution based on the fork length data measured by one on-board observer for redfish (2016-2021) (subarea 3).

### Yellowtail flounder

No catch was made in 2020 and 2021. Average sizes were similar during 2016-2019 (ave. 34-35cm). Size frequency distributions for four years formed unimodal (peak around 33 cm).

**Figure 9.** Size frequency distributions based on the total length data collected by one on-board observer for yellowtail flounder (2016-2019) (subarea 3).

## 4.2 Division 3K

Table 5 shows catch by species in Division 3K (1980-2021) (all gears combined). There were operations only for 11 years (1980-91 except 1983). Redfish was the largest catch (average=1,345 ton), followed by Cod (119 tons) and Greenland halibut (85 tons).

**Table 5.** Catch (tons) by species in Division 3K (1980-2021) (all gears combined)

Note:

(1) Data source: STATLANT21A based on the official statistics provided by Fisheries Agency of Japan.

(2) Japan joined NAFO in 1980.

(3) Majority gear is the bottom otter trawl.

(4) Blank means catch (tons) < 0.5 (including 0 catch) or no operations.

### 4.3 Division 3L

Table 6 shows catch by species in Division 3L (1980-2021) (all gears combined) except 1983 and during 2009-2015. Redfish and Greenland halibut were major target (TAC) species.

**Table 6.** Catch (tons) by species in Division 3L (1980-2021) (all gears combined)

CODE	CAT	COD	DGX	FIN	FLX	GHL	GRO	GSK	HAL	PLA	POK	RED	RHG	RNG	SHX	SKA	SQI	WIT	YEL

(4) Blank means catch (tons) < 0.5 (including 0 catch) or no operations.

#### 4.5. Division 3N

Table 8 shows catch by species in Division 3M (1980-2021) (all gears combined). Fisheries were not so active comparing to other Divisions except for the high capelin catch (1987-1990) (average =1,616 tons) and the high yellowtail flounder catch (2016-2019) (834 tons). No yellowtail founder catch was made in 2020 and 2021.

**Table 8.** Catch (tons) by species in Division 3N (1980-2021) (all gears combined)

**B. Special Research Studies**

## 1. Environmental Studies

- a) Hydrographic studies
- b) Plankton studies (including eggs and larvae)
- c) Benthic studies
- d) Observations on ice conditions in Subareas 0 to 4
- e) Other environmental studies

## 2. Biological studies by species

Material should be presented in the order of the life cycle, reporting studies on eggs and larval stages first.

## 3. Gear and selectivity studies, including studies on fishing operations

## 4. Miscellaneous studies

Not conducted in 2021.

## Annex A Frequency of total/fork length by 0.5 cm for GLH, RED and YEL

**Annex B. Fishing vessel in recent years (2016-2022)**

FV No 68 Fukuyoshi maru (stern trawler) (Gross Tonnage:401 t) (Photo 1) started her first fishing operation in the NAFO CA from April 8, 2016 (Division 3L) targeting Greenland halibut after 7 years absence of operations by other Japanese vessels. There is one scientific observer on-board.
