

Serial No. 2782  
(A.c.4)ICNAF Res.Doc. 72/63ANNUAL MEETING - JUNE 1972Efficiency of Sampling

by

Assistant Executive Secretary

In order to assess the adequacy of sampling the various fish stocks for length and age by the countries fishing in the Northwest Atlantic, the Statistics and Sampling Subcommittee recommended in 1970 that tables be prepared showing for each species, division, country and gear the number of fish sampled for length and age in relation to total catch (*Redbook* 1970, Pt. I, p.71). Data for the years 1969 and 1970 are presented in the Appendix to *Sampling Yearbook*, Volume 15.

Tables A and B present summaries of the 1969 and 1970 data in terms of the sampling efficiency by country and subarea. The "sampling efficiency" is defined as the ratio of "number measured" to "product of the catch in '000 tons times 200". Sampling efficiency values less than 1.0 indicate that the minimum ICNAF sampling requirement (200 length measurements for each 1000 tons of a species caught) has not been carried out.

Table A. Summary of sampling in relation to catch for 1969 by species, country, gear and subarea.

Species	Country	Gear	Catch ('000 tons) by Subarea with sampling efficiency in parentheses						Total
			1	2	3	4	5	6
