ANNUAL MEETING - JUNE 1976

Update of Redfish Status for 1975 in ICNAF Subarea 5

by

Ralph K. Mayo
National Marine Fisheries Service
Northeast Fisheries Center

ANNUAL MEETING - JUNE 1976

This paper presents updated information through 1975 for redfish in ICNAF Subarea 5 (Mayo, 1975).

Commercial Fishery

Redfish landings of 10,674 MT from Subarea 5 in 1975 were approximately equal to the 1974 level (Table 1). As in previous years, most of this catch was taken from Division 5Y. The catch per unit of effort index based on U.S. vessels landings 50% or greater redfish declined once again in 1975, continuing a trend evident since 1968 (Table 3). This drop in catch per unit of effort coupled with a stabilized total catch resulted in an increase in the calculated total effort in Subarea 5.

A plot of the 1974 and 1975 catch and effort levels on the yield curve used in Res. Doc. 75/59 to determine the TAC is presented in Figure 1. Using the Method of Walter (1975), the estimated TAC's desired to rebuild the stock fall between 9,000 and 13,000 metric tons. Commercial length frequencies show a continued rise in mean length of both males and females indicating little or no recruitment to the exploitable population in 1975 (Table 4, Figure 2).

Research Vessel Surveys

Data from autumn research cruises of ALBATROSS IV from 1963 to 1975 are presented in Table 5. Catch per tow indices show a sharp increase in abundance in the offshore strata and a slight increase in abundance in the inshore strata in 1975. Length frequencies (Figure 3) indicate that this increase in the offshore strata may be attributed primarily to increases in fish in the 30-40 cm size group.

This increase in the survey catch per tow index, however, was not reflected in the commercial catch per unit of effort index which dropped from 5.0 to 4.0 metric tons per day between 1974 and 1975.

Improved recruitment in the upcoming years is indicated by the survey length frequency data (Figure 3).

Since 1971, a mode of pre-recruit fish has been increasing in size to between 16 and 22 cm in 1975. Redfish in this length mode were also beginning to appear in the commercial length sample data in 1974 and 1975. The recruitment of these fish to the commercial fishery should continue for the next few years.
