ANNUAL MEETING - JUNE 1976

Movements of herring tagged in the Bay of Fundy - Update

by

W.T. Stobo
Environment Canada
Fisheries and Marine Service
Biological Station
St. Andrews, N.B., Canada

Introduction

In 1973-64 Canada conducted several herring tagging experiments in the Bay of Fundy area. Tag recoveries reported to March 1975 have been reported previously (Stobo *et al.*, 1975) and this paper is intended as an update to that report.

Results

That portion of ICNAF Subarea 4 and 5 in which the tagging experiments were conducted and recoveries made is shown in Fig. 1 for reference. The recoveries reported to March 1976 from each tagging experiment are presented in Fig. 2-6 and a general summary of the recoveries is given in Fig. 7.

Overall a 2.8% return has occurred with a range from 1.1% to 7.3% for individual tagging experiments (Table 1). Generally the revised data substantiate the results and discussion of the previous document. There appears to be substantial movement across the Bay of Fundy from all tagging experiments and substantial outward migration during the winter. The data indicate a greater movement by the fish tagged off Nova Scotia than by fish tagged off New Brunswick.

A total of 57 tags have been recovered in the Div. 4Wa fishery, 46 during the 1974/75 fishery and 11 during the 1975/76 fishery. The recoveries have been made from all tagging locations and indicate substantial movement of fish from both sides of the Bay of Fundy into Div. 4Wa in winter. No recoveries have been made from Div. 4V. Three recoveries had been reported during the 1974/75 fishery but additional information has been received from the boats involved which indicate that the fishing actually occurred off Canso in Div. 4Wa.

A much greater proportion of the fish moving westward out of the Bay of Fundy occurred from the New Brunswick experiments than from the Nova Scotia experiments (Table 1), although the Nova Scotia fish generally migrated farther westward (Fig. 7). Most of the recoveries made in Subarea 5 were from USA coastal fisheries, but 10 tags were recovered from the Jeffrey's Ledge area and 2 from Georges Bank.

Discussion

In view of the substantial number of recoveries made in the Canadian Div. 4Wa fishery in 1974/75 and 1975/76 from the Bay of Fundy experiments and the lack of recoveries from Subdiv. 4Vn, the management of Div. 4V separately and the combining of Div. 4Wa with Div. 4XWb, as recommended by STACRES, are the most logical management units.

The considerable movement across the Bay of Fundy suggests that the New Brunswick fisheries should be considered in the Div. 4WX assessment even though the New Brunswick fisheries are largely juvenile fisheries and the tagging experiments were mainly adult fish.

Further, the movement westward suggests a substantial stock intermix problem that needs additional tagging experiments in Subarea 5 and additional consideration in future assessments.
